

Hands on tutorial #2: Setting up a simulation

LMDZ team

December 10-12, 2024

This tutorial focuses on the various steps required to set up a 3D simulation, and in particular for a zoomed configuration of LMDZ.

If you have already installed the model with the script `install_lmdz.sh` in Tutorial #1, go directly below to "**Setting up a simulation...**". Otherwise, start by installing the model as indicated in Tutorial #1 (Sections 1 and 2).

Setting up a simulation with a (regular or) zoomed grid

- Go to the directory `LMDZTraining/LMDZseq/modips1/modeles/LMDZ`, which contains the files `makelmdz_fcm`, `libf` etc. In this directory, download and unpack the `tutorial.tar` file, then go in the resulting `TUTORIAL` folder :

```
# If you are in your LMDZTraining folder :
cd LMDZseq/modips1/modeles/LMDZ
wget http://lmdz.lmd.jussieu.fr/pub/Training/tutorial.tar
tar -xf tutorial.tar
cd TUTORIAL
```

- Examine the content of the `TUTORIAL` folder : there are some scripts and a `DEF` directory, all briefly described in the `Readme` file. In the `DEF` directory, edit the file `gcm.def` and examine the different parameters defining the grid.

By default, the defined grid has the zoomed area centered at (0E,45N)

(`clon=0.`, `clat=45.`) and a zoom factor = 2 both in longitude and latitude :

(`grossismx=2.`, `grossismy=2.`).

In order to place the center of the zoom at your preferred location, you just need to change the longitude and latitude of the zoom center, `clon` and `clat`.

If you want to use a regular grid, set `grossismx=1.` and `grossismy=1.` .

- Check the following options in `init.sh`, and change the default value if needed :
 - * As you installed the model in sequential mode, you must have `parallel=0.`
 - * The option for radiative code must be `rad=oldrad.`
 - * For the time being, you will run LMDZ **without** the surface scheme `Orchidee`: you must have the option `veg=NONE` (instead of the default "`CMIP6`"). The model will be run with a simplified scheme for surface hydrology: the “bucket” scheme.

- * ATTENTION : For those using a gfortran version older than 10. (cf WARNING in Tutorial #1) : in `opt_compile` at lines 57 and 61, you need to replace the option `-arch $machine` by `-arch local-gfortran9 -arch_dir /path to your/LMDZTraining/arch`

- Increase the stack memory by typing the following command:

```
ulimit -Ss unlimited
```

or, even better, add this command in you shell start-up file (if you use Bash, your start-up file can be `.profile` or `.bash_profile`).

- Run the script :

```
./init.sh
```

The script `init.sh` does the following :

- (re)compiles the model (`gcm.e`) with resolution 48x36x39 (remember that in tutorial 1 you've used 32x32x39);
- compiles the program `ce01.e`, needed to create initial state and boundary conditions for the chosen grid;
- downloads input files for `ce01.e` (NetCDF files containing surface orography, sea-surface temperature etc.);
- runs `ce01.e` , which creates files `start.nc`, `startphy.nc` and `limit.nc` in a directory called `INITIAL`. These files will be used to initialize a new simulation in a newly-created directory called `SIMU1`.

Please check that these 3 files have been created in the directory `SIMU1`. If not, ask for our help.

- Now edit the file `SIMU1/config.def`, and look at the section "Controle des sorties" (Eng. "Output control"). In the high-frequency NetCDF output file #3, `hsthf.nc`., you'll want to include the variable `pres`, containing the pressure at model levels. To do that, add the following line :

```
flag_pres__00003 = 4
```

- make sure that `iflag_rrtm` is set to 0 and that `NSW` is set to 2 in `physiq.def` (`oldrad` mode)
- You can now go in the `SIMU1` directory and run the model by executing the command `./gcm.e` (output on screen) or `./gcm.e > listing1` (output in file `listing1`). The simulation should end with the message "Everything is cool" (on screen, or at the end of `listing1` file), and the output files `hstday.nc`, `hstmth.nc` and `hsthf.nc` should be created. Make some plots from one of these files.
