

Etude des cycles avec LMDZ: contribution du groupe ORCHIDEE

Reunion PEDALON - 2 Dec 2024

(Philippe Peylin. pour le groupe projet ORCHIDEE)

ORCHIDEE from CMIP6 to CMIP7-FT

Adding forest demography & forest management

Tree height varies !

Forest has Gaps !

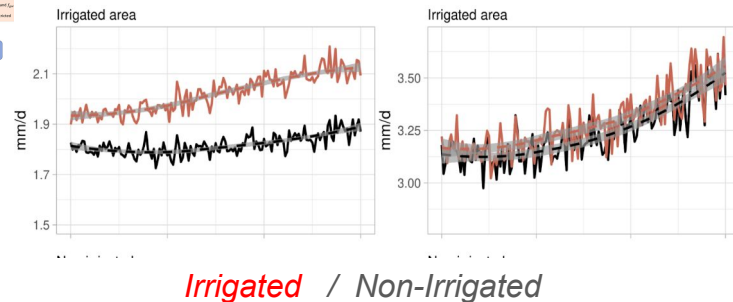

Two streams
RT model !

Improved water routing scheme & irrigation

Evap.

Precip.

Including N cycle and C-N interactions

Strong link with
chemistry of
N-compound in
the atmosphere

Updated snow scheme and snow albedo

⇒ Soon same
snow scheme for
all land surfaces
including icecap

Adding physical and biogeochemical permafrost !

ORC-LMDZ simulation:
Diff with ERA5 reanalysis !
(ex: Juin - Juillet - Aout)

Tair
2
meters

⇒ Large feedback
loop late spring
between frozen soil
and surface
atmosphere air
temperature
(via snowfall fraction)

Snowfall
fraction

No soil insulation
with SOM

$S_{LH} - ERA5$

With SOM
insulation

$S_{LH + SI} - ERA5$

$S_{LH} - ERA5$

$S_{LH + SI} - ERA5$

Coupling between the land surface and LMDZ

ORC today !

Currently adding :

- Multiple Energy budget (for each PFT)
- Multi-layer canopy budgets

ORC tomorrow !

⇒ Need to re-define the coupling between Vegetation canopy and the PBL ?

Alleon et al., in prep

- Canopy discretized in N layers;
- One big leaf energy budget per layer;
- Multi-layer SW and LW radiation transfers;
- Turbulent transport model between layers;
- Implicit resolution.

Coupling between the land surface and LMDZ

ORC today !

Currently adding :

- Multiple Energy budget (for each PFT)
- Multi-layer canopy budgets

ORC tomorrow !

⇒ Need to re-define the coupling between Vegetation canopy and the PBL ?

Alleon et al., in prep

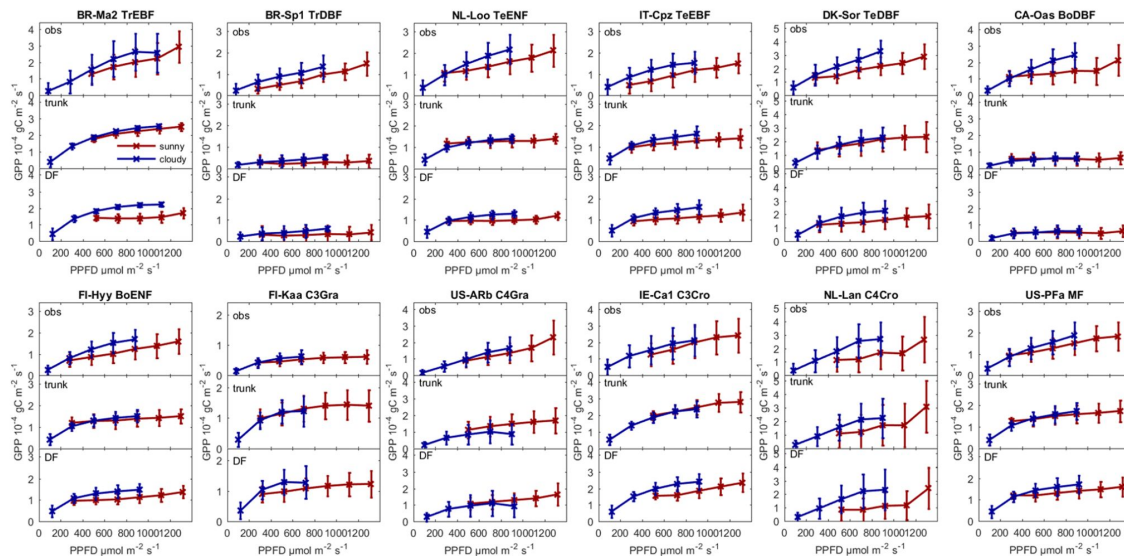

Coupling between the land surface and LMDZ

⇒ Need to account for direct vs diffuse light fraction

⇒ Significant impact on the GPP

(Yuan Zhang et al. 2023)

sunny
cloudy

⇒ Intra-canopy CO_2 concentration should also impact GPP !

⇒ Possible with futur multi-level energy model

CO_2 free air

decrease in the canopy

Current representation in ORCHIDEE

Use of LMDZ Zoom : case of High Resolution Land Cover project

ORC-LMDZ simulation: Zoom over Etiopia

<https://orchidas.lsce.ipsl.fr/dev/esa-hrlc/africa.php>

AFRICA ZOOM

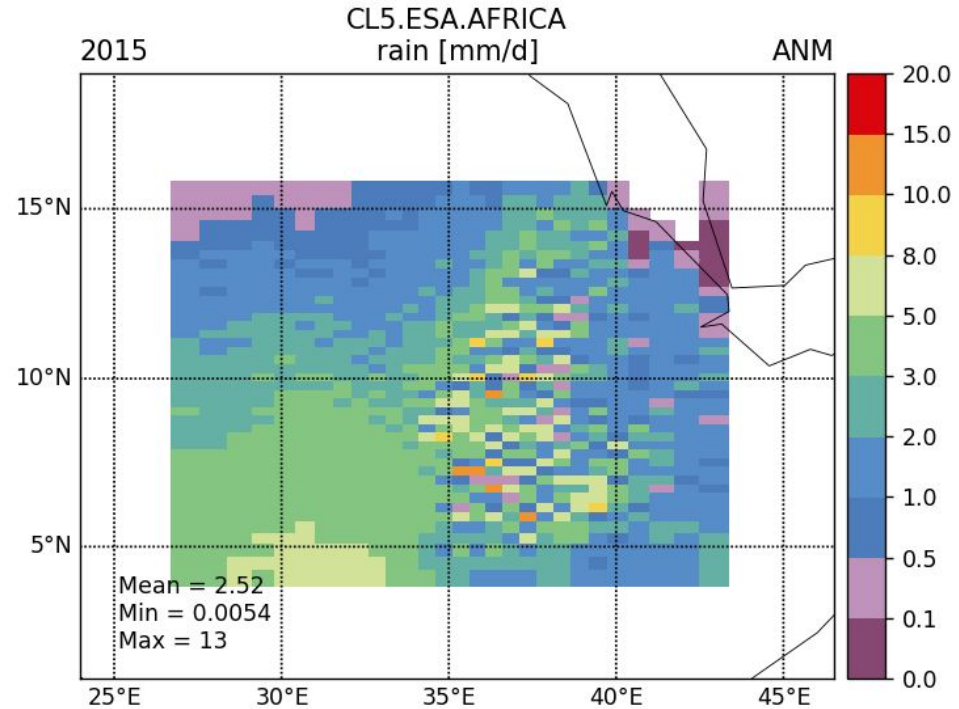

LMDZOR (version 6.1.9, resolution 142x144, NPv6.1.3)

Nudged simulation for 1966-2015

Configuration (changes from the standard set):

- day_step=3360
- iperiod=7
- tetagdiv=1200.
- tetagrot=1200.
- tetatemp=1200.
- iphysiq=35
- clon=35.25
- clat=10.
- grossismx=5.0
- grossismy=5.0
- dzoomx=0.046
- dzoomy=0.066

Grid cell size in the zoom center : dx = 54.8 km, dy = 28.2 km

Expérience de déforestation avec IPSL-CM6

Artificial deforestation

(Boysen et al. 2020)

Impact on Tair surf

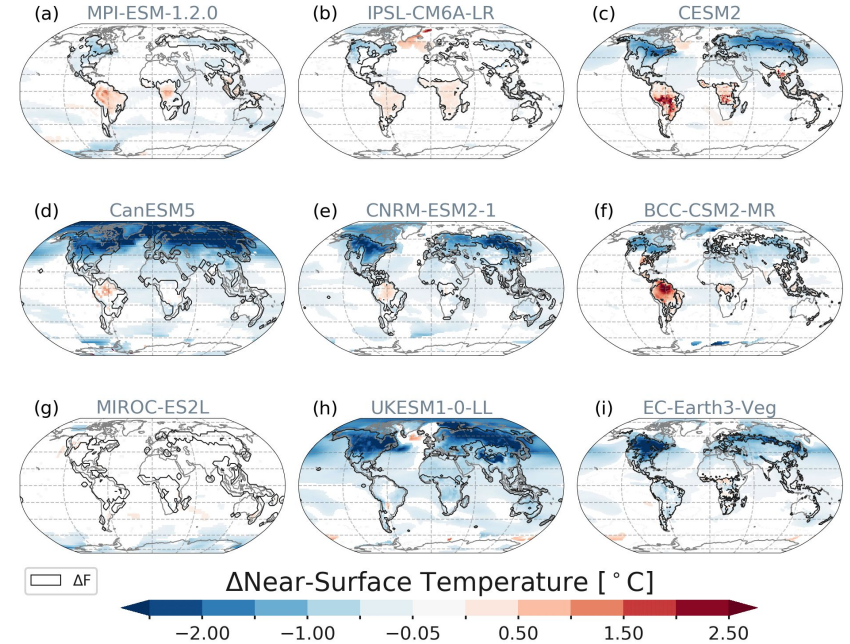

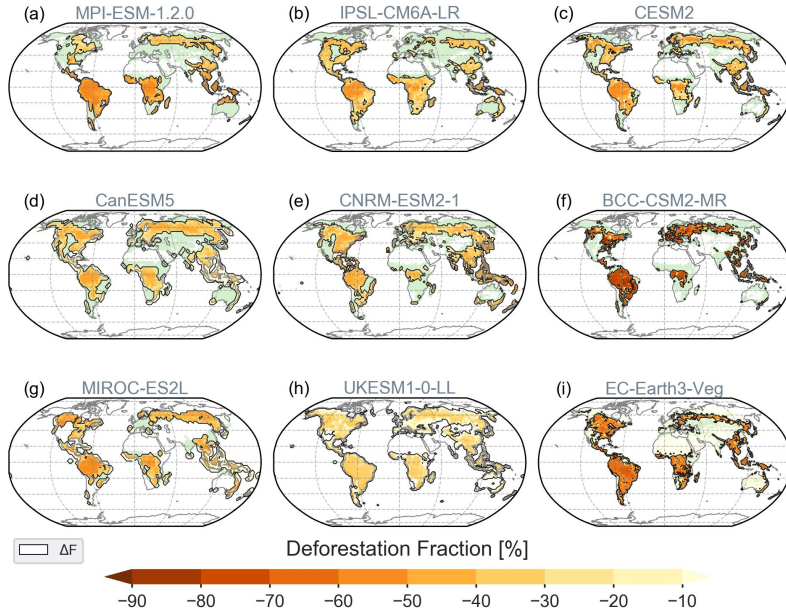

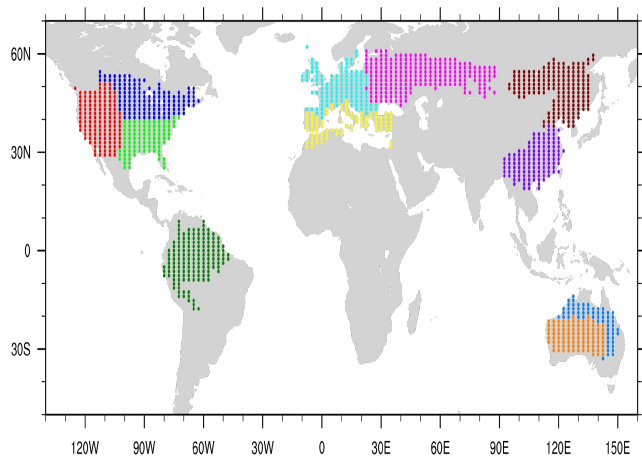

Figure 1 Deforestation fractions ΔF in percent (%) of the grid cell area after the forced forest clearing is finished, shown in orange; green colours display the remaining forest extent. A map of the initial forest fractions can be found in the Supplement (Figs. S1 and S2). Contours of the deforestation areas (ΔF) with deforested grid cell fraction exceeding 0.001 % are used in all maps of the analysis.

Figure 2 Spatial patterns of near-surface air temperature (ΔT_{as}) responses averaged over year 50 to year 79. Only statistically significant changes at the 5 % significance level are shown (modified t test, Zwiers and von Storch, 1995). Contours depict the areas of deforestation (Fig. 1).

Etude exhaustive des vagues de chaleurs présentes et future (CMIP6, LS3MIP)

Heatwave characteristics in the recent climate and at different global warming levels: a multimodel analysis at the global scale

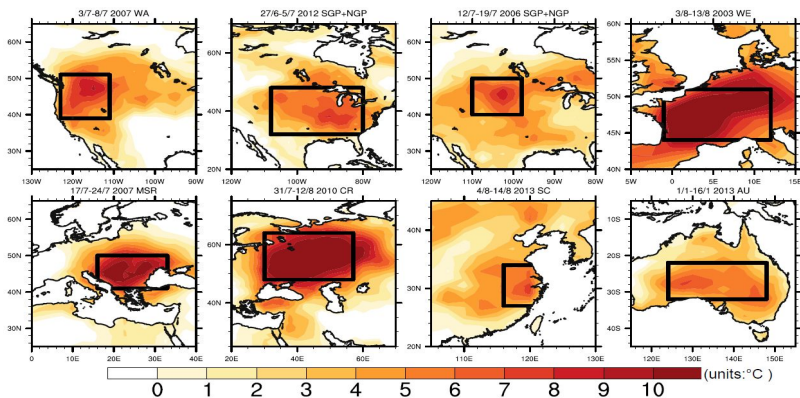

- Western American (WA)
- Southern Great Plains (SGP)
- Northern Great Plains (NGP)
- Mediterranean Regions (MSR)
- Western Europe (WE)
- Central Russia (CR)
- Northeast Asia (NA)
- Southeast China (SC)
- Central Australia (CAU)
- Northern Central Australia (NAU)
- Amazonia (AMA)

Biais HW days – noHW days (3 warmest months, AMIP)

CONTRIBUTION OF CIRCULATION AND SOIL MOISTURE TO RECENT HW TEMPERATURE ANOMALY

Recent HW (temperature anomaly, wind nudged)

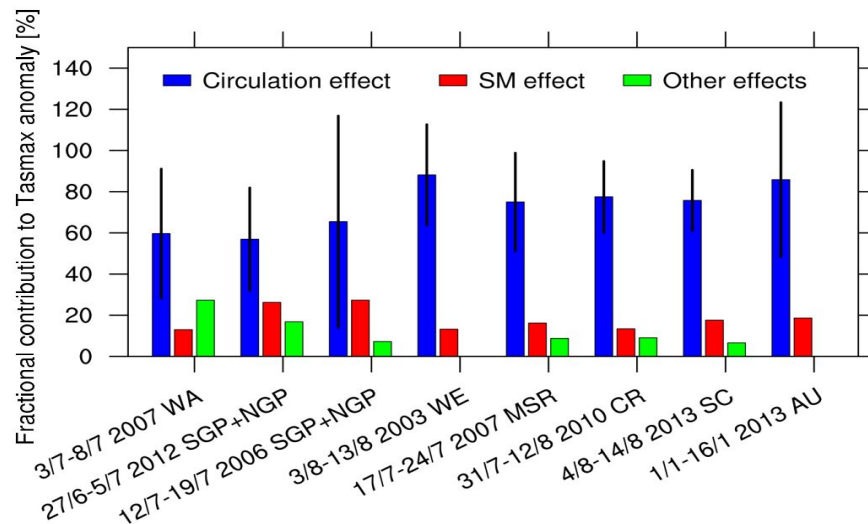

- 21 SST, SIC forced (AMIP/IPSL-CM6) : atmF_smF
- LMDZOR, SST forced, wind forced, SM climato forced : atmN_smclim
- LMDZOR,SST forced, wind forced, SM daily « obs » forced : atmN_SMN

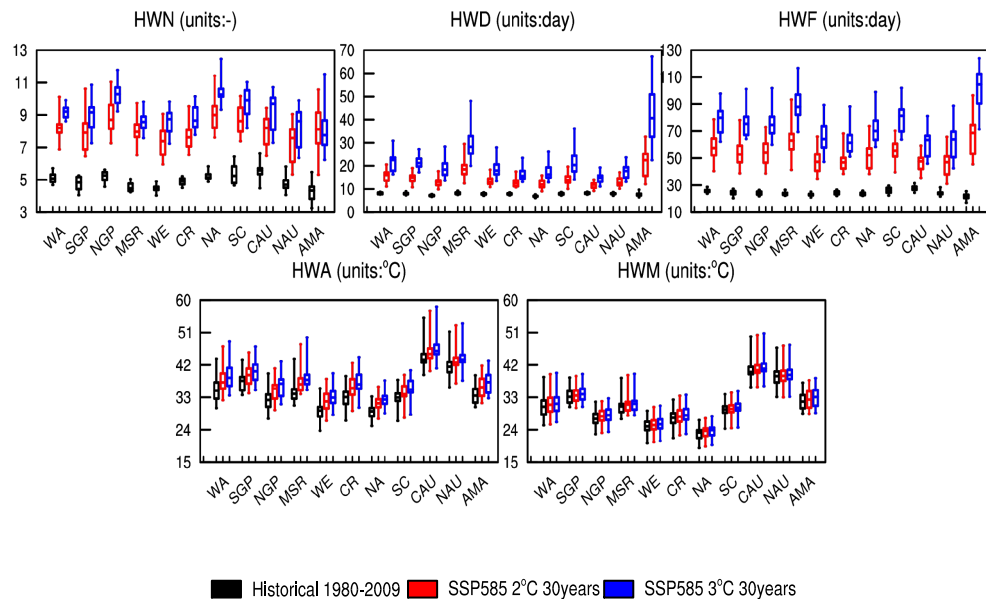

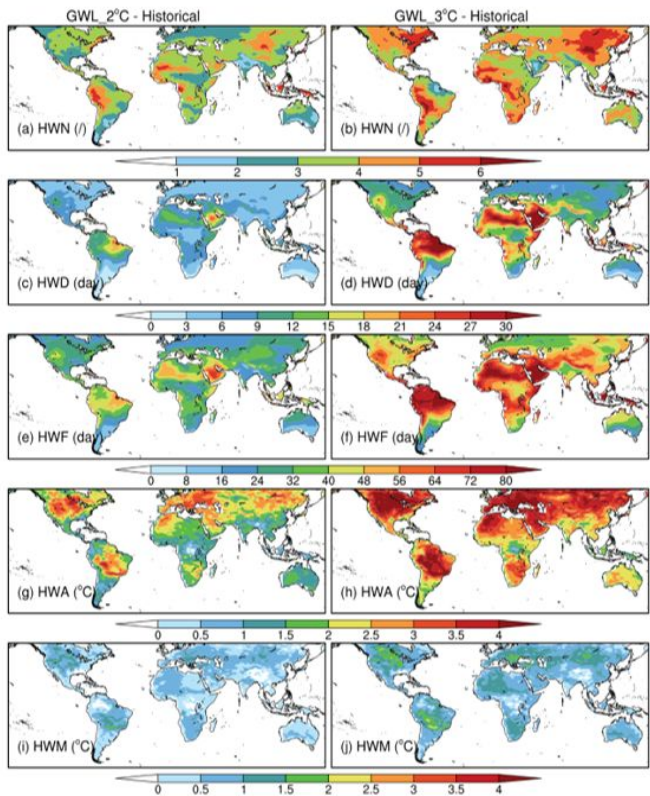

Circul effect = atmN_smclim - atmF_smF

SM effect = atmN_smclim - atmN_smN

ANO_{atmN_smN} = 100% signal (after Wehrli et al. (2019))

Heatwave characteristics in the recent climate and at different global warming levels: a multi-model analysis at the global scale

daily values of SM, evap, rh not provided by most models
 => difficult to evaluate the impact of bias in present time on the future HW

Bilan des demandes spécifiques

- Revoir ensemble le couplage Canopée - PBL (hauteur arbres variables !)
 - Stabilité de la PBL : cas régions arctiques !
 - A terme couplage avec modèle multi-layer
- Rayonnement :
 - Besoin d'inclure séparation direct / diffus pour la Photosynthèse !
 - Compatibilité modèle 2 stream dans la canopé avec RT de LMDZ ?
- Multi-tiling (bilan energy séparé par PFT / Lac / glaciers /)
 - Mélange des flux de surface dans la PBL : instantané ou progressif ?
- Albedo de surface ORCHIDEE
 - Dépendance à l'humidité du sol ? (potentiellement important)
 - Si déforestation => Quel albedo pour le sol nu ?

Bilan des demandes spécifiques

- Couplage avec modèle de feux : “éclaircs” sont potentiellement important (see Patricia’s talk)
- Mortalité des forêts par “tempêtes” !
 - Besoin d’avoir les “coup de vent locaux” en surface (“gust”) ?
- Spin-up of LMDZ-ORCHIDEE pour le C devient plus compliqué ! (A cause de la discretisation verticale : plus de solution analytique)
 - Utilisation possible d’émulateurs d’ORCHIDEE (en cours; D. Goll)
- Optimisation des paramètres ORCHIDEE en mode ORC-LMDZ :
⇒ activité croissante..

Optimization du modèle couplé ORC - LMDZ

- Parameter calibration of the coupled model ORCHIDEE - LMDZ
 - Test of ORCHIDEE alone with History Matching (Simon Beylat PhD)
⇒ Difficult when considering a large number of parameters (> 100)
 - Ongoing test with a 4DVar-ensemble method (pseudo data test using atmospheric CO2 concentration data to optimize ORCHIDEE Vcmax parameters)

Figure 4. The Root Mean Squared Differences (RMSD) scores of the simple case for each of the 21 atmospheric stations between synthetic observations and prior simulations are represented by the green triangle. The RMSD scores between synthetic observations and posterior simulations given by the ϵ -4DVar (4DVar) method are represented by the purple + symbol (red \times symbol)
