

# LMDZ tutorial

Configurations, input files, forcing data

Lionel GUEZ  
Olivier BOUCHER (part on aerosols)  
LMD

# Contents

- Configurations
- LMDZ with realistic physics
- Aqua-planet or all-land planet
- Relaxation to a 3D-temperature field

Configurations: many ways to use LMDZ

# Coupling with another model

- Soil, vegetation, hydrology: **Orchidée**  
<http://labex.ipsl.fr/orchidee>
- Ocean, sea ice, marine biogeochemistry:  
**Nemo**  
<http://www.nemo-ocean.eu>
- Tropospheric chemistry , aerosols: **INCA**  
<http://www-lscea.inca.cea.fr>
- Stratospheric chemistry: **Reprobus**  
Marchand et al., JASTP, 2012

# Configurations of LMDZ itself

- 1 or 3 dimensions
- Nudging
- Zoom
- Realistic or idealized "physical" part of the model

Use case:  
LMDZ alone  
3 dimensions  
no nudging  
realistic (terrestrial) physics

# What is left to choose

- Some run-time parameters (among which concentration of greenhouse gases)
- Initial state
- Boundary (that is, surface) conditions
- Forcing atmospheric data: ozone field, fields of aerosols

# Run-time parameters

- Chosen in text files which have suffix `.def`
- Home › Utilisateurs › Guides › LMDZ pas à pas › Utilisation comme boîte noire › **Variables des fichiers `.def`**

# Run-time parameters (continued)

- Syntax:  
variable=value  
Case sensitive  
TRUE or FALSE for logical values  
Character values without quotes  
Comment lines start with #  
Example: `gcm.def`
- Semantic separation of run-time parameters among six .def files

# Run-time parameters (continued)

- gcm.def: dynamics
  - Zoom: **clon** and **clat** (center), **grossim[xy]** (zooming factor), **dzoom[xy]** (range), **tau[xy]** (steepness of transition)
- physiq.def: parameterizations

# Run-time parameters (continued)

- config.def: level of output, coupling with other models, radiative transfer, forcing data (ozone, aerosols, greenhouse gases)
  - No ocean model: `type_ocean=force`
  - No coupling with Orchidée: `VEGET=bucket`
  - Concentration of greenhouse gases: `co2_ppm`, `ch4_ppb`...
  - Number of calls to radiative transfer procedure, per day: `nbapp_rad`

# Run-time parameters (continued)

- output.def: fine tuning of output (choice of variables, frequency...)
- run.def: length of the run, dates, calendar
  - Number of days of run: **nday**
  - Starting date: **dayref** (day number in the year) and **anneeref**
  - Calendar: **calend** (character variable)

# Run-time parameters (continued)

- **traceur.def**: tracers
  - Special syntax
  - 1st line: number of tracers
  - Then one line per tracer, with a number identifying the advection scheme
  - For more information on available advection schemes: infotrac.F90

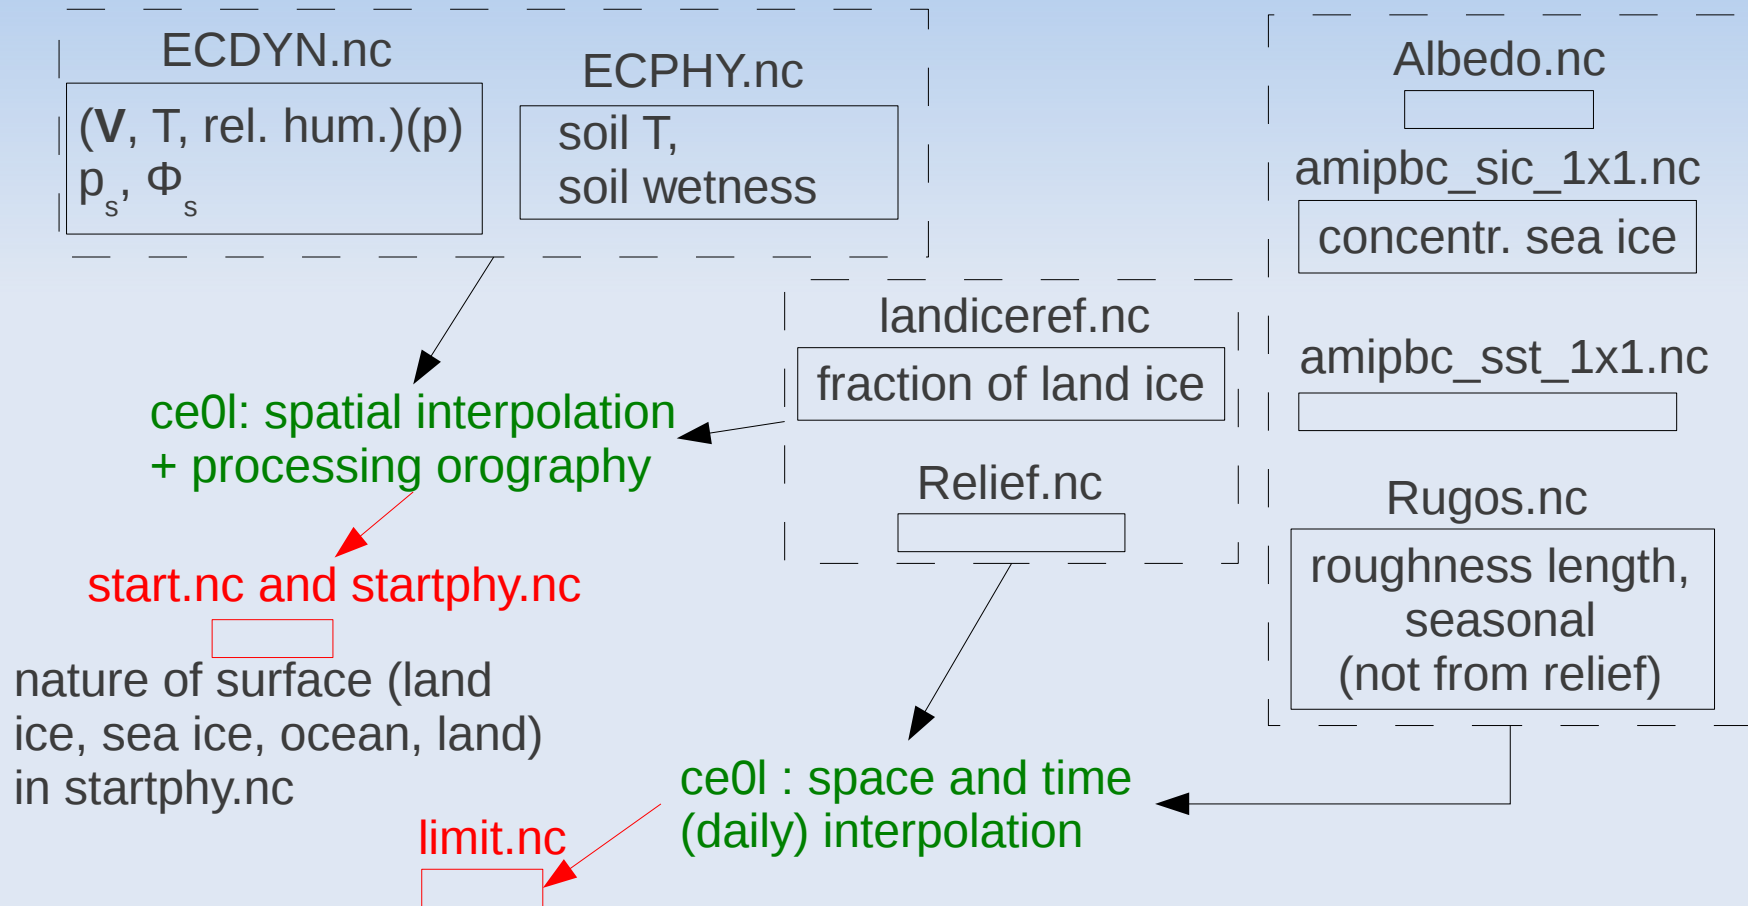

# Initial state and boundary conditions

- Separate program: ce0l
- Distributed with the program gcm, compiled with the same tools
- Home → Utilisateurs → Guides → LMDZ pas à pas → **Utilisation comme boîte noire**
- Run ce0l with the same .def files than those you want for gcm  
Exception: calendar

# Initial state and boundary conditions (continued)

- ce0l creates 2 files for initial state:  
start.nc for the dynamics part of gcm  
startphy.nc for the physics part of gcm
- ce0l creates 1 file for 1 year of boundary conditions:  
limit.nc

# Initial state and boundary conditions (continued)

# Calendar

- Calendar is used in ce0l to create boundary conditions
- For years with constant length, 360 or 365 days:  
calend=earth\_360d  
or  
calend=earth\_365d  
Same value for ce0l and gcm

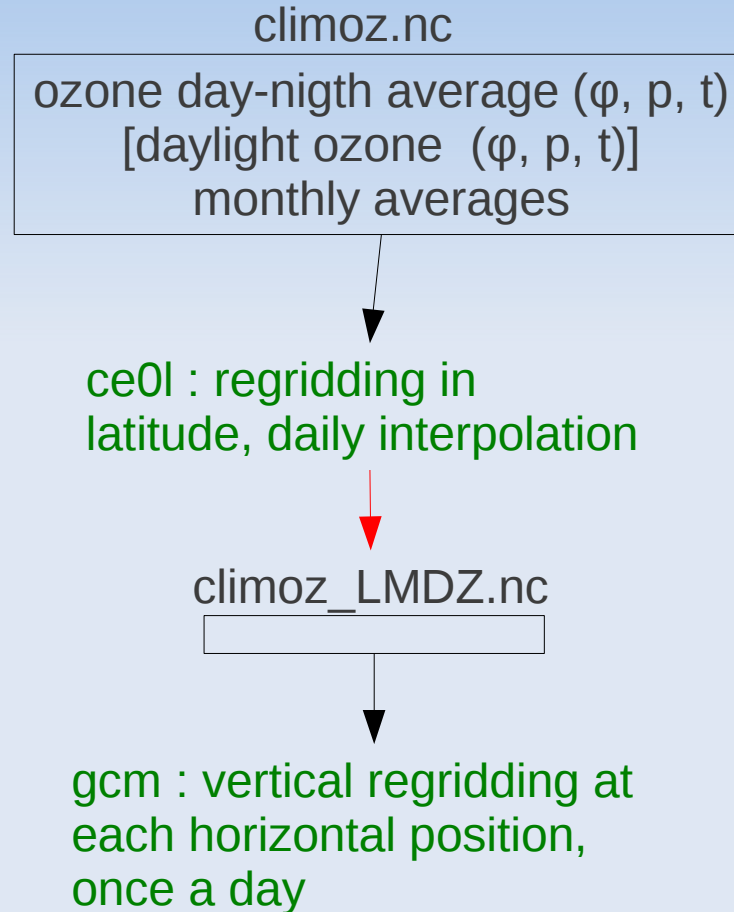

# Calendar (continued)

- For the real calendar (with leap-years):
  - Run `ce0l` for each year you want boundary conditions for:  
`calend=gregorian`  
`anneeref=<the right year>`
  - For `gcm`: `calend=earth_366d`

# Ozone

- Run-time parameter in config.def:  
`read_climoz=0, 1 or 2`
- 0: analytic expression for the ozone field (see `ozonecm_m.F90`)
- 1: read day-night average of ozone field from a file
- 2: also read daylight average from the same file (good idea if there are a few model layers in the mesosphere)

# Ozone (continued)

# Aerosols: running without INCA

- Reminder: for LMDZ – INCA version with interactive aerosols, management of radiative transfer is different
- LMDZ without INCA:  
run-time parameter in config.def  
`aerosol_couple = FALSE`

# Nature of aerosols

Run-time parameter in config.def  
**flag\_aerosol** (integer):

- 0: no aerosol
- 1: sulfate
- 2: black carbon
- 3: particulate organic matter
- 4: marine salts
- 5: dust
- 6: all

# Aerosols: input files

- If `flag_aerosol > 0`:  
gcm reads aerosol data from files  
`aerosols.nat.nc`  
[+ another file, depending on `aer_type`]

# Aerosols: input files (continued)

- Run-time parameter `aer_type` (character variable) in `config.def`:
  - `preind`: pre-industrial aerosols → `aerosols.nat.nc` only
  - `actuel`: when you want to use a climatology of anthropogenic aerosols → `aerosols.nat.nc` + `aerosols1980.nc` (fixed name, meaningless)
  - `annuel`: `aerosols.nat.nc` + `aerosolsYYYY.nc` where `YYYY` is the current year

# Aerosols: input files (continued)

- Input files should contain concentrations of aerosols of all the desired types (according to `flag_aerosol`)
- Input files should already be horizontally regridded to the gcm grid

# Aerosols: direct and indirect effects

- Run-time parameters `ok_ade` and `ok_aie` (logical) in `config.def` to activate direct and indirect effects of anthropogenic aerosols
- If `ok_ade = FALSE` then direct effect of natural aerosols only  
If `ok_aie = FALSE` then indirect effect of natural aerosols only

# Aerosols: direct and indirect effects (continued)

- You can choose `ok_ade` and `ok_aie` independently
- `flag_aerosol` must be  $\geq 1$  if `ok_ade` or `ok_aie` is TRUE
- If `ok_ade` or `ok_aie` is TRUE then corresponding diagnostics are output (in particular variables to compute radiative forcings, `topswad` ou `topswai`)

# Stratospheric aerosols

- Run-time parameter **flag\_aerosol\_strat** (logical) in config.def, independent of other aerosol flags
- If TRUE, gcm reads 3D aerosol input data from files with monthly timestep
- Input data are available over period 1850 to 2010
- An IDL script prepares input file for various model resolutions

# Aerosols for expert users

- Run-time parameter `new_aod` (logical):  
to use the most recent parameterization of  
aerosol optical depth.  
TRUE is the default value.  
Note: `new_aod=FALSE` can only be used with  
`flag_aerosol=1` (sulfate aerosols only).

# Aerosols for expert users (continued)

- Run-time parameters in config.def:

`bl95_b0=1.7`

`bl95_b1=0.2`

(recommended values)

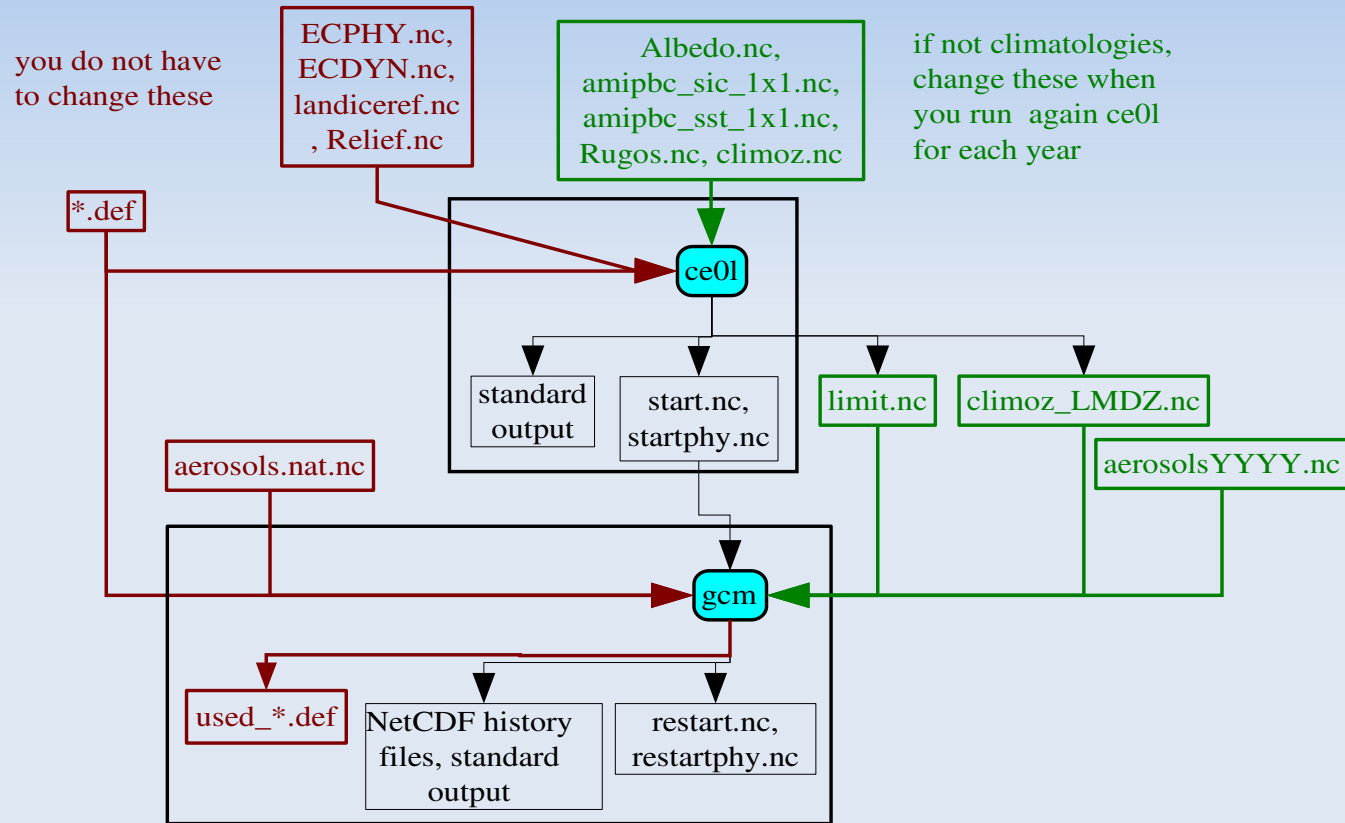

Link cloud droplet number concentration to aerosol mass concentration

(Boucher and Lohmann, 1995)

# Aerosols for expert users (continued)

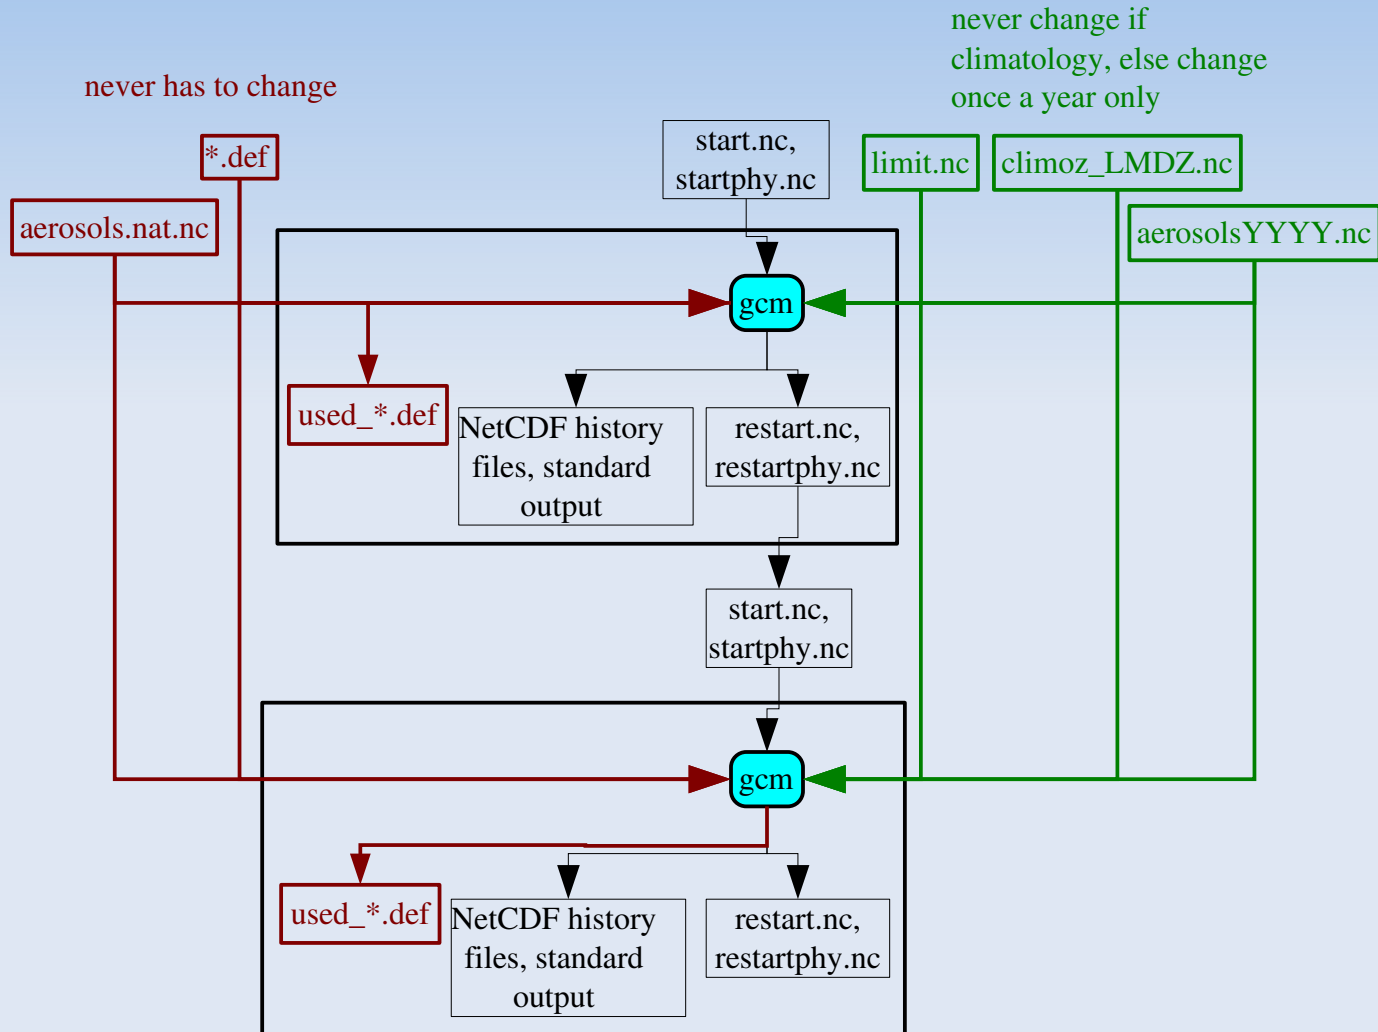

- If you want to compute at each time step the direct or indirect effect that aerosols would have, but not let those effects impact the simulation:
  - Set the variable **aerosolfeedback\_active** to .false. in procedure sw\_aeroAR4.F90
  - Recompile the program
  - Choose flag\_aerosol > 0 and ok\_ade = TRUE or ok\_aie = TRUE at run-time

# Putting it all together

# Chaining one-month runs

Where do you get the input files ?

# Run-time parameters

Template .def files are distributed with LMDZ source files

- Directory **DefLists**
- physiq.def\_L39\_AR40.0: 39 levels, physics used for AR4, old physics
- physiq.def\_L39\_NPv3.2: new physics

# Initial state and boundary conditions

NetCDF files required by ce0l are in:

- [http://www.lmd.jussieu.fr/~lmdz/LMDZ\\_Init](http://www.lmd.jussieu.fr/~lmdz/LMDZ_Init)
- **DODS server**  
<http://dods.extra.cea.fr/work/p86ips1/IGCM/STORAGE/INIT/ATM>

# Forcing data for CMIP 5

- A lot of data, for pre-industrial, historical or future simulations (with different scenarios)
- NetCDF files are stored at the national supercomputing centers, IDRIS and CCRT, so you need to find access to them

# Forcing data for CMIP 5: ozone

- `gaya:~rpsl035/IGCM/INIT/ATM/LMDZ/Ozone/HYBRIDE/v2.clim/tro3_${year}.new.nc`
- **Wiki**  
<http://forge.ipsl.jussieu.fr/igcmg/wiki/InfosOzone>

# Forcing data for CMIP 5: aerosols

- `gaya:~rpsl035/IGCM/BC/ATM/LMDZ/LMD9695/AR5/HISTORIQUE/aerosols_11YearsClim_${year}_v5.nc`
- Each file contains all aerosol types.
- **Wiki**  
<http://forge.ipsl.jussieu.fr/igcmg/wiki/InfosAerosol>

Aqua-planet or all-land-planet

# Definition

- Zero relief
- Only one type of surface globally : either land or ocean
- Surface temperature is:
  - forced for an aqua-planet
  - computed for a land-planet (we still have to choose an initial field)

# Selecting the aqua- or land-planet

- Run-time parameter **iflag\_phys** (integer) in gcm.def  
Choose  $\text{iflag\_phys} \geq 100$  (instead of default value 1 for Earth surface, full physics)
- $\text{iflag\_phys} = 101$  to 114: aqua-planet  
 $\text{iflag\_phys} = 201$  to 214: land-planet  
Different  $T_s$  fields, constant for aqua-planet, initial value only for land-planet

# Selecting the aqua- or land-planet (continued)

- See (analytic) definition of the 14  $T_s$  fields in procedure `profil_sst`

# Initial state and boundary conditions

- You do not go through the ce0l step
  - Set run-time parameter `read_start` to FALSE in `gcm.def`  
gcm creates an initial state
  - gcm also creates a file `limit.nc` for boundary conditions
- gcm creates `restart.nc` and `restartphy.nc` so switch `read_start` to TRUE for the next run

# Forcing data

It may be a good idea to use adapted ozone and aerosol fields, symmetrical about the equator

Idealized physics: relaxation to a given  
3-dimensional temperature field

# Selecting temperature relaxation

Set run-time parameter `iflag_phys=2` in `gcm.def`

- Analytic definition of the 3D equilibrium temperature field
- Damping of low-level wind to represent boundary-layer friction
- From Held and Suarez (1994)
- Some run-time tuning parameters (relaxation time...), see `inicaademic.F90`

# Initial state, no boundary condition

- You do not go through the ce0l step
  - Set run-time parameter `read_start` to FALSE in `gcm.def`  
gcm creates an initial state
  - No file `limit.nc`
- gcm creates `restart.nc` and `restartphy.nc` so switch `read_start` to TRUE for the next run

# Note

- No other forcing data
- You do not use `physiq.def`, `config.def` nor `output.def`
- You can bypass compilation of physics files with option `-p nophys` of `makeImdz` → much quicker compilation
