

## **LMDZ : use and configurations**

- 1. Operating modes of the 3D GCM**
  - a) Free climatic mode**
  - b) Zooming or/and nudging for climate**
  - c) Tracer transport**
  
- 2. Intercomparison exercises and reference versions**
  - a) IPSL climate model and CMIP exercises**
  - b) LMDZ reference versions**
  - c) Robust improvements from version to version**
  - d) Evolution of climatic biases and sensitivity**
  
- 3. Model development and tuning**
  - a) Choice of a new configuration : content and resolution**
  - b) Importance of tuning**
  - c) Methodology 1D/nudged simulations/tuning**

# LMDZ : Un modèle / des configurations

## Coeurs 3D

- Longitude-latitude
- Icosaèdre
- (bientôt disponible)
- Aire limité
- (en préparation)

## Cas 1D

### (Dephy/High-Tune)

LES à disposition  
20 aine de cas

- Convection
- RCE
- Nuages bas
- Couplage surf.

Campagne

3D explicite (LES)

Modèle uni-colonne

## Atmospheric component of the IPSL integrated climate

## model LMDZ4

## Mode d'utilisation 3D

- Climatique couplé ou non
- Océan slab
- $\beta$ -clim/bucket
- Zoomé
- Guidé ou initialisé
- Aqua ou terra planète

## IO/Evaluation :

- Multi-atlas sur ciclad
- Pilotage xml de XIOS
- Simulateurs satellite

## Couplage en surface (4 sous surface/maille)

- Océan : SST forcées, **Nemo**, Océan slab
- Banquise : imposée (conduction LMDZ), **Lim**, slab
- Continents : **Orchidee**, bucket, betaclim
- Glaciers : bucket ajusté

## Composition

- **Inca** (chimie/aérosols)
- **Reprobus** (chim./strato)
- LMDZaer (arérosols)
- Isotopologues de l'eau

# **Which model version and which setup should I use for my work ?**

*Depends on the problem you want to address  
The first question should be :*

## **What do I need a model for ?**

*Those questions are an essential part of YOUR WORK*

*The presentation tries to help you answer to question #1 once you have the answer to question #2*

## 1. Operating modes : a) free climatic mode

### Climate change projections

→ Global coupled ocean-atmosphere model. Model not perfect. Biases.

## 1. Operating modes : a) free climatic mode

### Climate change projections

- Global coupled ocean-atmosphere model. Model not perfect. Biases.
- Analyzed in terms of statistics. Biased on average. Variance ...

## 1. Operating modes : a) free climatic mode

### Climate change projections

- Global coupled ocean-atmosphere model. Model not perfect. Biases.
- Analyzed in terms of statistics. Biased on average. Variance ...
- Perturbed versus control run (small perturbation compared to biases)

## 1. Operating modes : a) free climatic mode

### Climate change projections

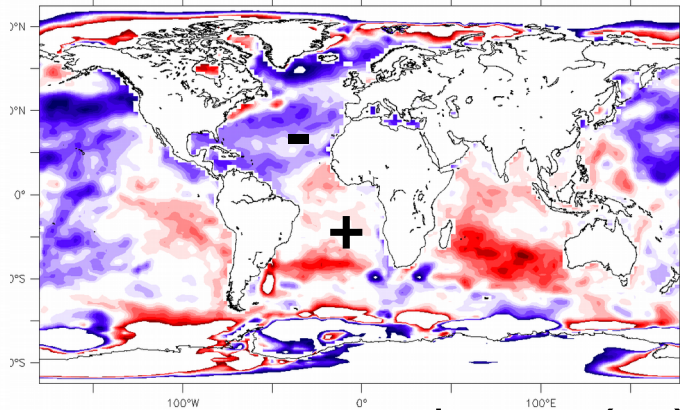

- Global coupled ocean-atmosphere model. Model not perfect. Biases.
- Analyzed in terms of statistics. Biased on average. Variance ...
- Perturbed versus control run (small perturbation compared to biases)
- Scenarios of future concentrations or emissions

# 1. Operating modes : a) free climatic mode

$\Delta$  SST : [1955-1965] - [1975:1985]

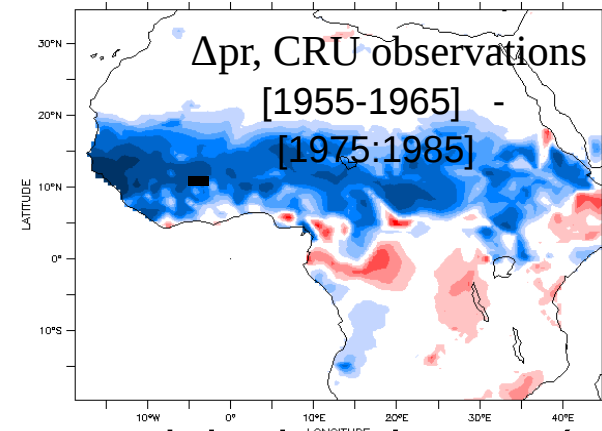

Temperature change (°C)

- 1975-1985 :
- Warm SSTs in the south
  - Drought over Sahel
  - A large scale pattern
  - Linked to sea surface
  - Temperature changes.

$\Delta$ pr, CRU observations  
[1955-1965] - [1975:1985]

Precipitation change (mm/year)

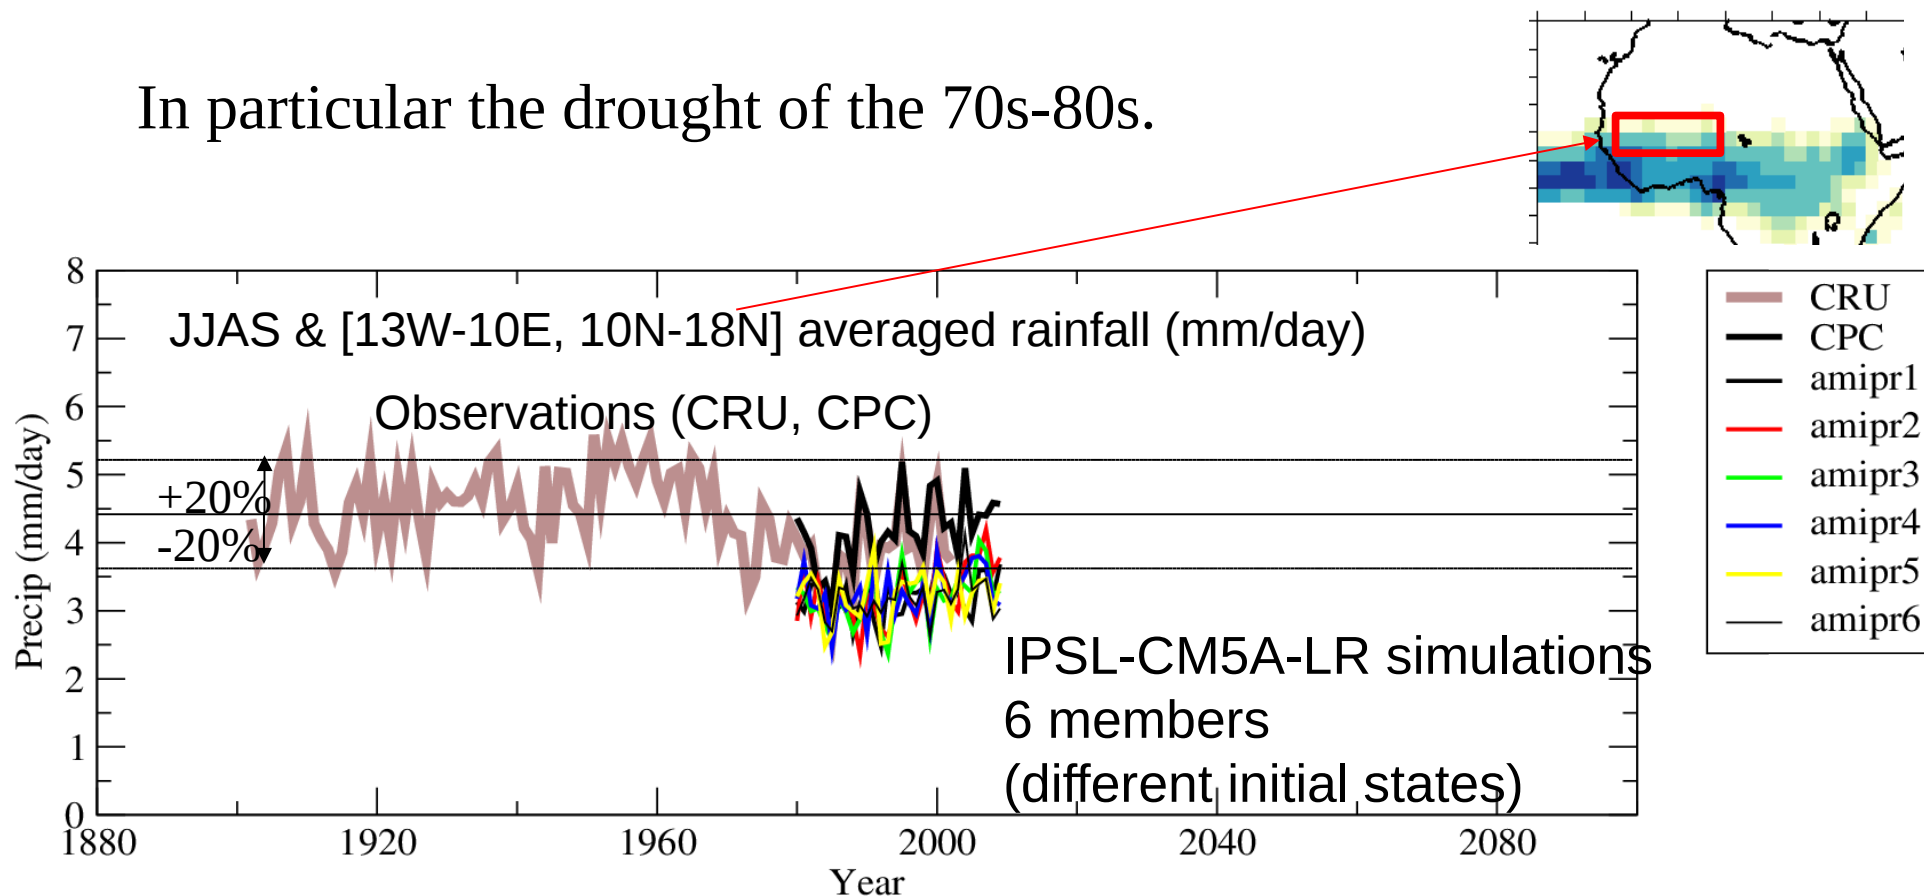

Example 2 : the Sahelian drought

## 1. Operating modes : a) free climatic mode

Are the model able to represent the climate variability of the past decades ?

In particular the drought of the 70s-80s.

**AMIP with imposed Sea Surface Temperature (SST)**

# 1. Operating modes : a) free climatic mode

## Are the model able to represent the climate variability of the past decades ?

In particular the drought of the 70s-80s.

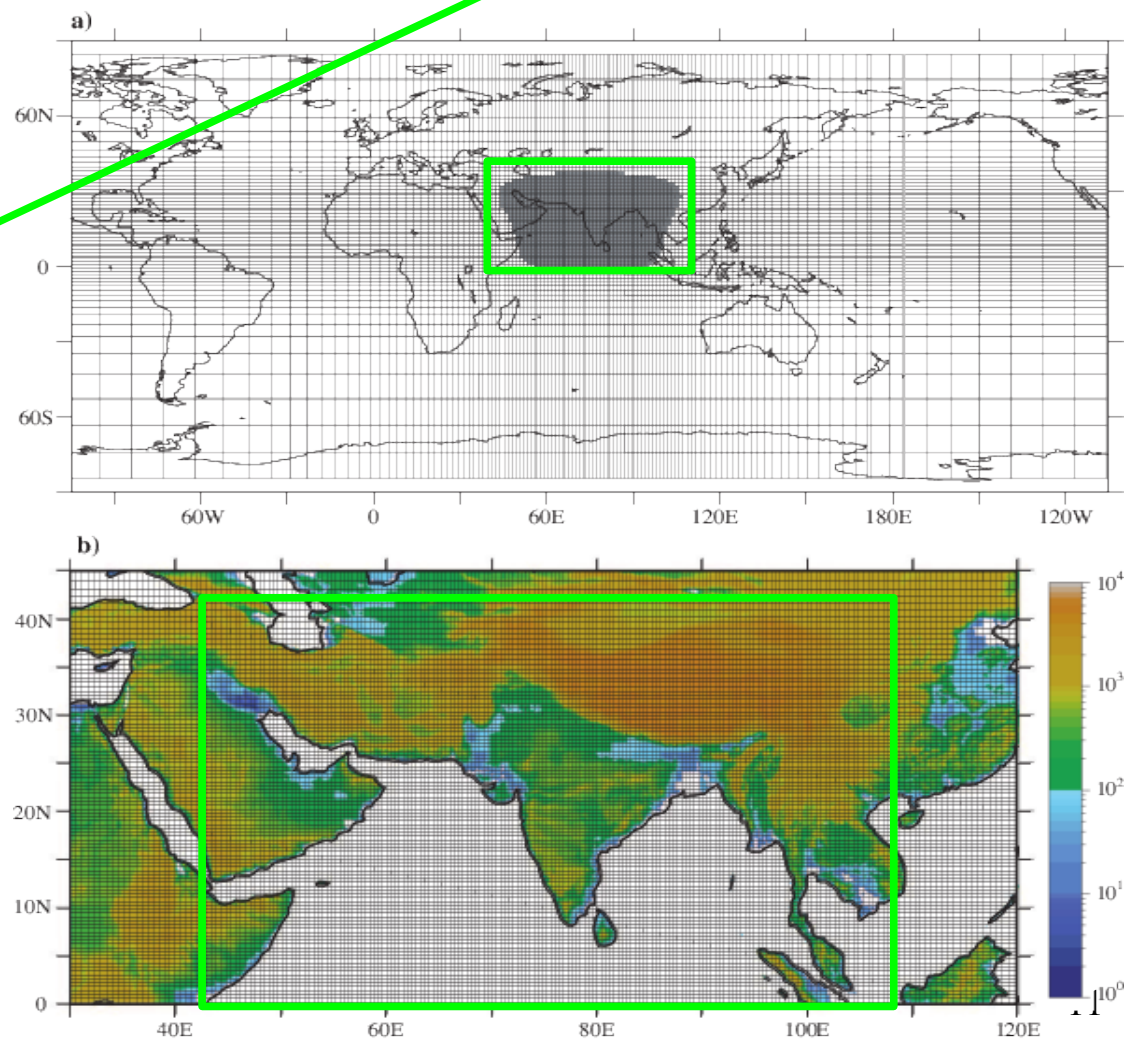

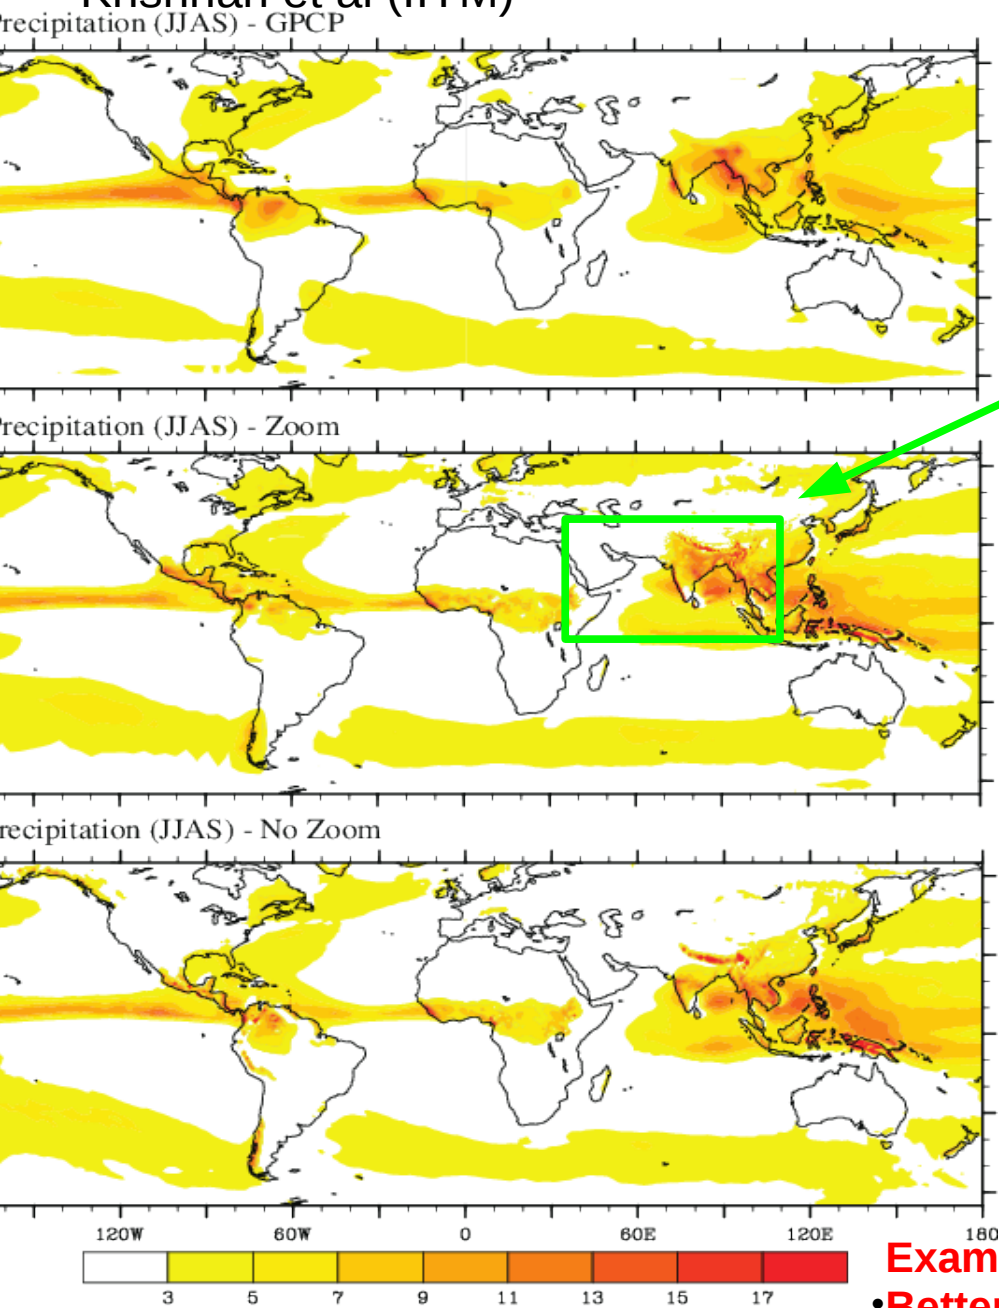

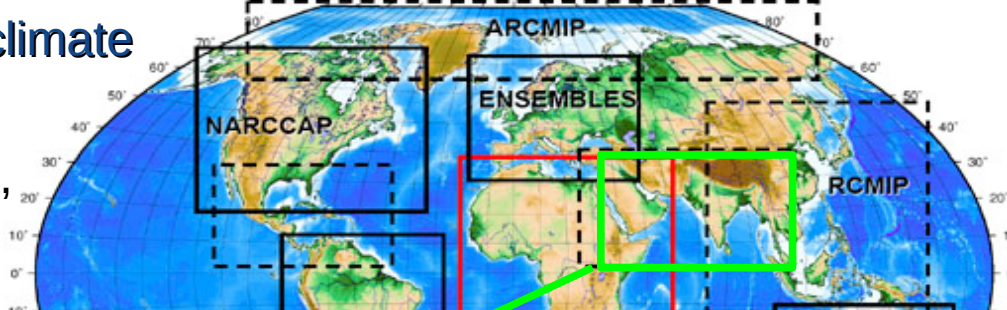

**Simulations have a skill to reproduce decadal variations of monsoon rainfall in response to sea surface temperature changes**  
**But strong internal variability even with imposed SSTs**  
**The observation is one possible experience**

# 1. Operating modes : b) Zooming or/and nudging for climate

Free climate simulation with zoom

Zoomed free climate simulation for Cordex South Asia, Krishnan et al (IITM)

**Example of improvement due to increased resolution**  
**• Better representation of depressions coming from Bay of Bengal**

# 1. Operating modes : b) Zooming or/and nudging for climate

## Nudging capability

$$\frac{\partial X}{\partial t} = F(X) + \frac{X^a - X}{\tau}$$

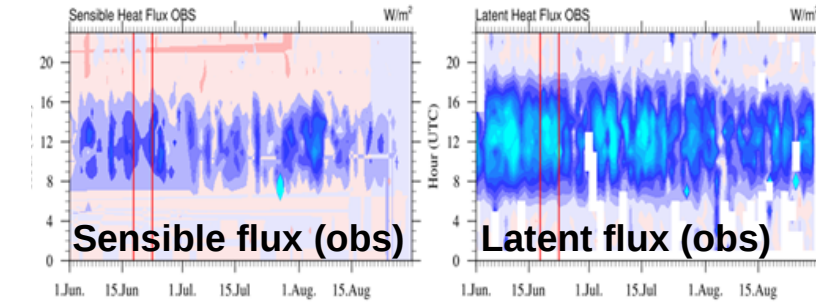

**X** : model state variables, u, v, T, q  
**X<sup>a</sup>** : X from (re)analysis regridded on the model grid  
**F(X)** : state variables model tendencies  
**τ** : time constant

Often using nudging in u and v only  
 relying on the model physics for the  
 thermodynamics (~ simulations with  
 imposed large scale dynamics)

Frédérique Chéruy

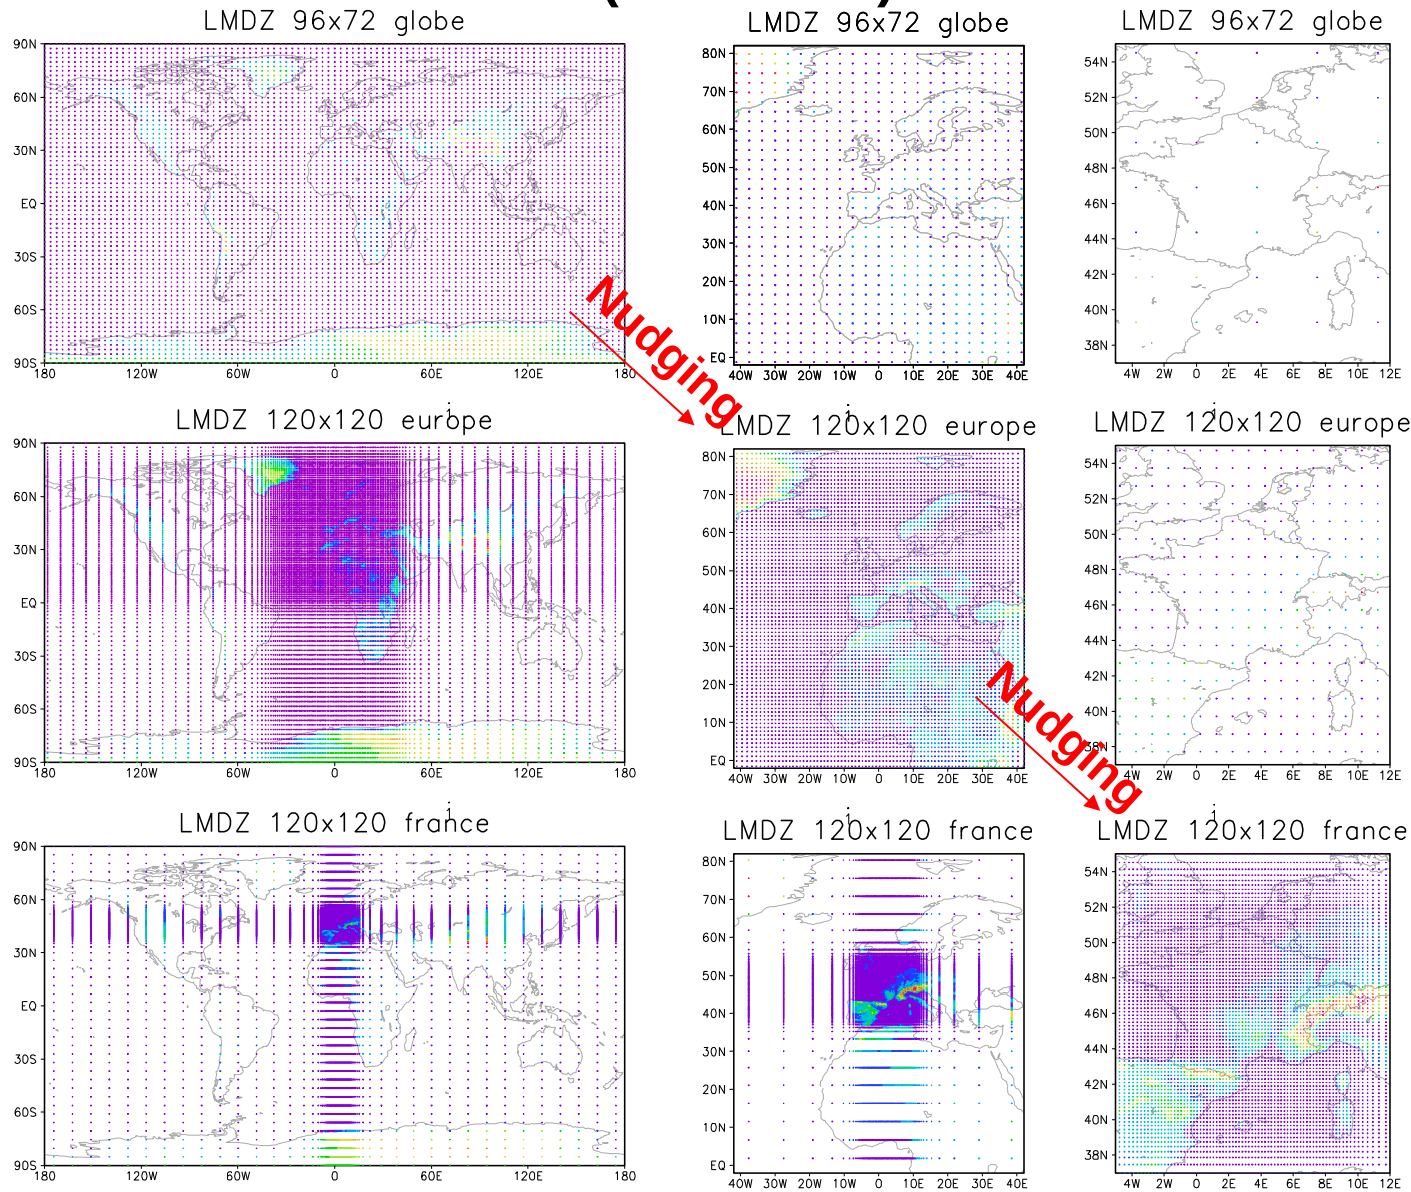

## HEAT-WAVE SUMMER 2017

# 1. Operating modes : b) Zooming or/and nudging for climate

Use for climate downscaling

## LMDZ - Grid Cascade - (Laurent Li)

LMDZ Globe  
(300 km)

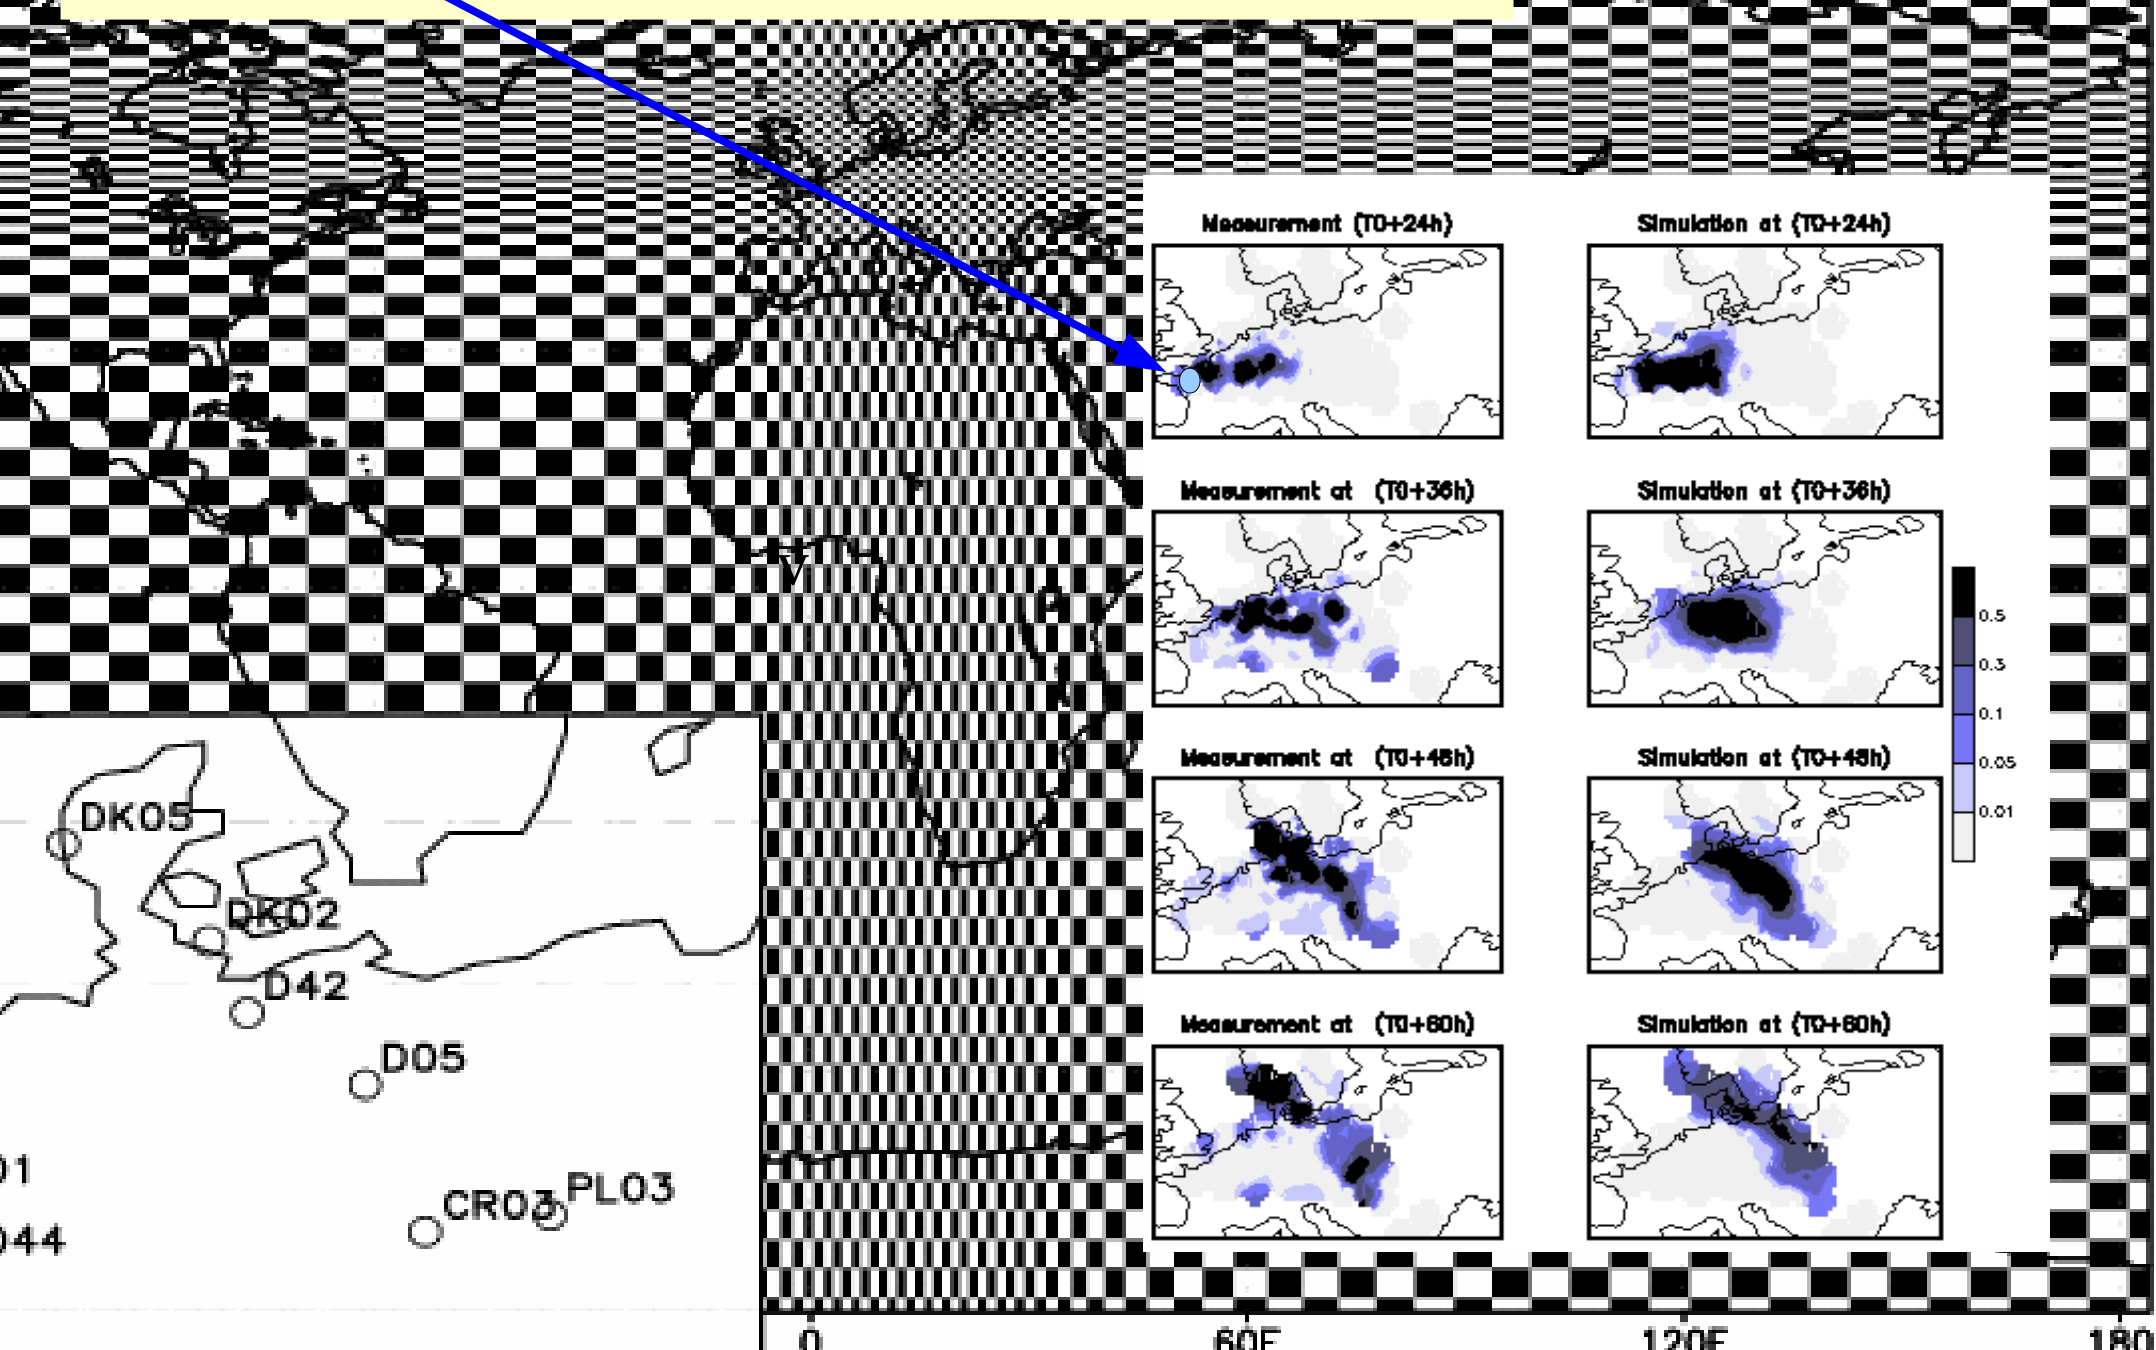

LMDZ Europe  
(100 km)

LMDZ France  
(20 km)

Similar to what is done with limited area models (like WRF)

# 1. Operating modes : c) Tracer transport

Numerical simulation with LMDZ  
Chemical tracer (PMCH) emitted in French Brittany (ETEX)

# 1. Operating modes : c) Tracer transport

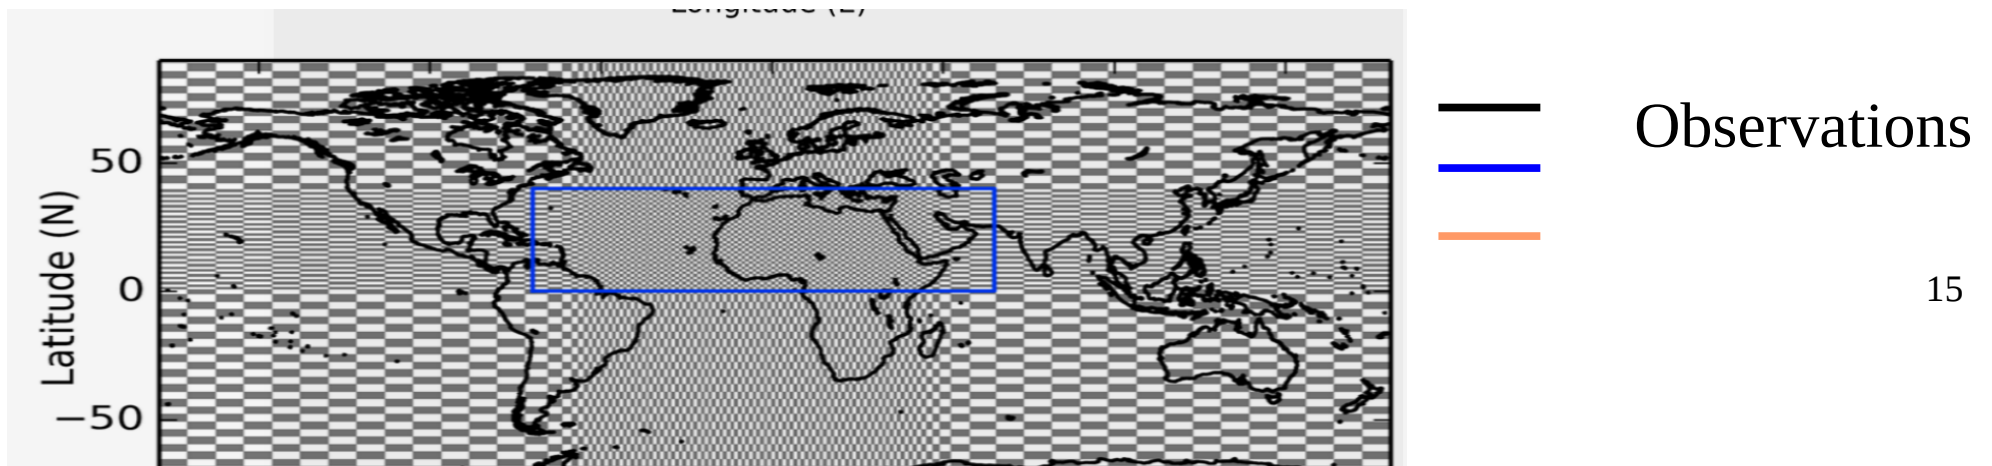

SW downward flux surf. (W/m<sup>2</sup>)

LW downward flux surf. (W/m<sup>2</sup>)

Coupled simulations with interactive aerosols (Dialo et al., 2017)  
Tracer concentrations in  $\mu\text{g} / \text{kg}$ , 2006

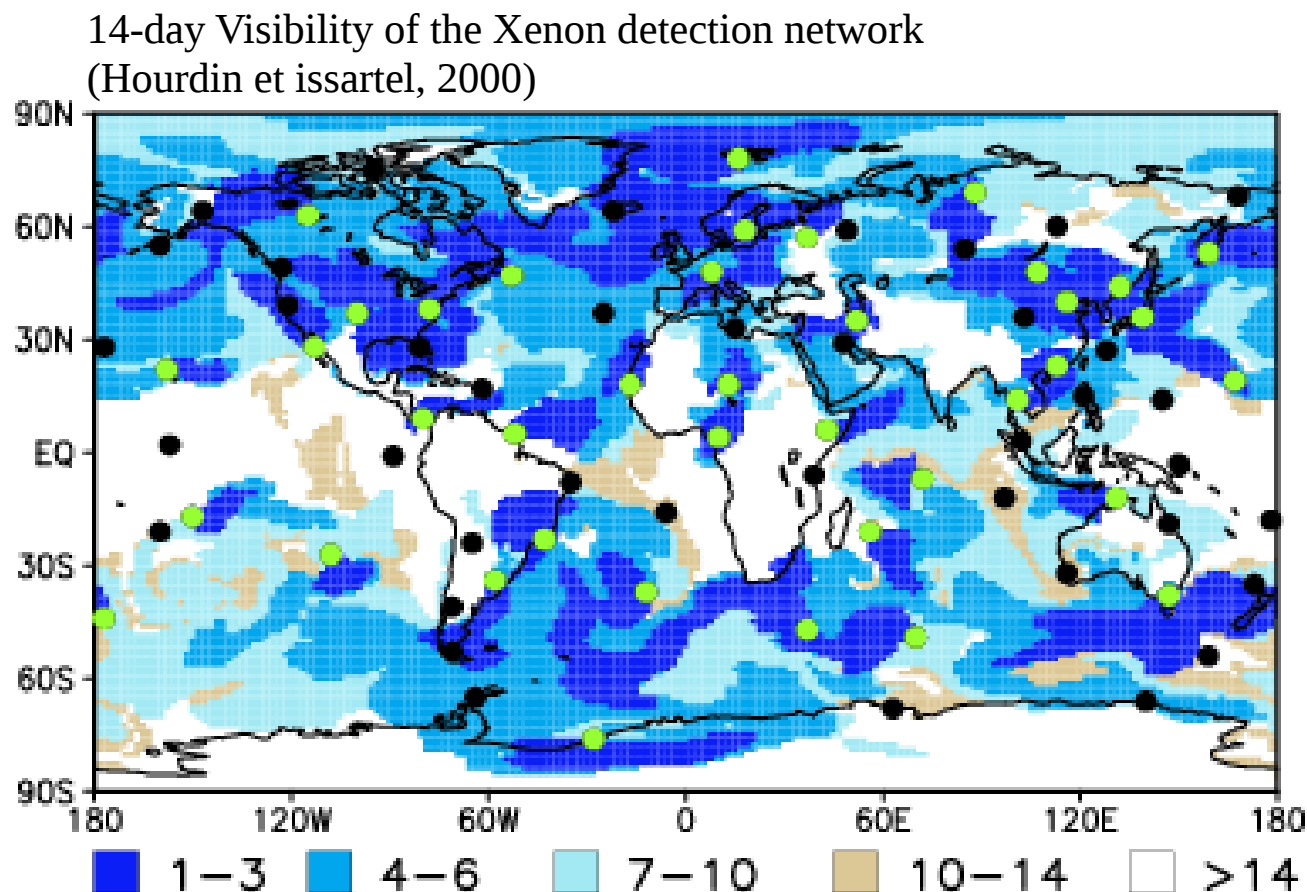

## 1. Operating modes : c) Tracer transport

Use in off-line transport model, direct and inverse

- First simulations with full meteorology computation
- Storing the explicit mass fluxes, turbulent coefficient, sub-scale mass fluxes
- Run transport of tracers only, in direct or backward mode ( ↔ adjoint model)

Example of back-tracking simulation  
Off-line model used in reverse mode

**Retro-transport** : transport is computed injecting a tracer at the detection stations (green) reversing the time to come back to the possible origins.  
Equivalent to an adjoint computation  
Used also for estimation of CO<sub>2</sub> and CH<sub>4</sub> inversions.

## 4. Operating modes

### Summary of 3D operating modes

## 2. Reference configurations : b) LMDZ reference configurations

### The different physical packages of LMDZ reference versions

#### LMDZ5A (old or standard physics)

- Diffusion scheme (Louis, 1979)
- Deep convection (Emanuel, 1991)
- Cloud scheme (Bony et Emanuel, 2001)

#### LMDZ5B (« new physics »)

- Diffusion scheme (Yamada, 1983)
- Thermal plume model except in strato cumulus regions (Rio et al., 2010)
- Cold pools (Grandpeix et Lafore, 2010)
- Deep convection controlled by thermals and wakes (Rio et al., 2012)
- Bi-gaussian cloud scheme for shallow convection (Jam et al., 2013)

#### LMDZ6 = LMDZ5B ++

- + Thermal plume model everywhere
- + Stochastic triggering of deep convection
- + Different convective mixing formulation
- + Thermodynamical effect of ice
- + RRTM for infrared radiation and SW 6 bands
- + Better boundary layer for stable conditions
- + Non orographic gravity waves

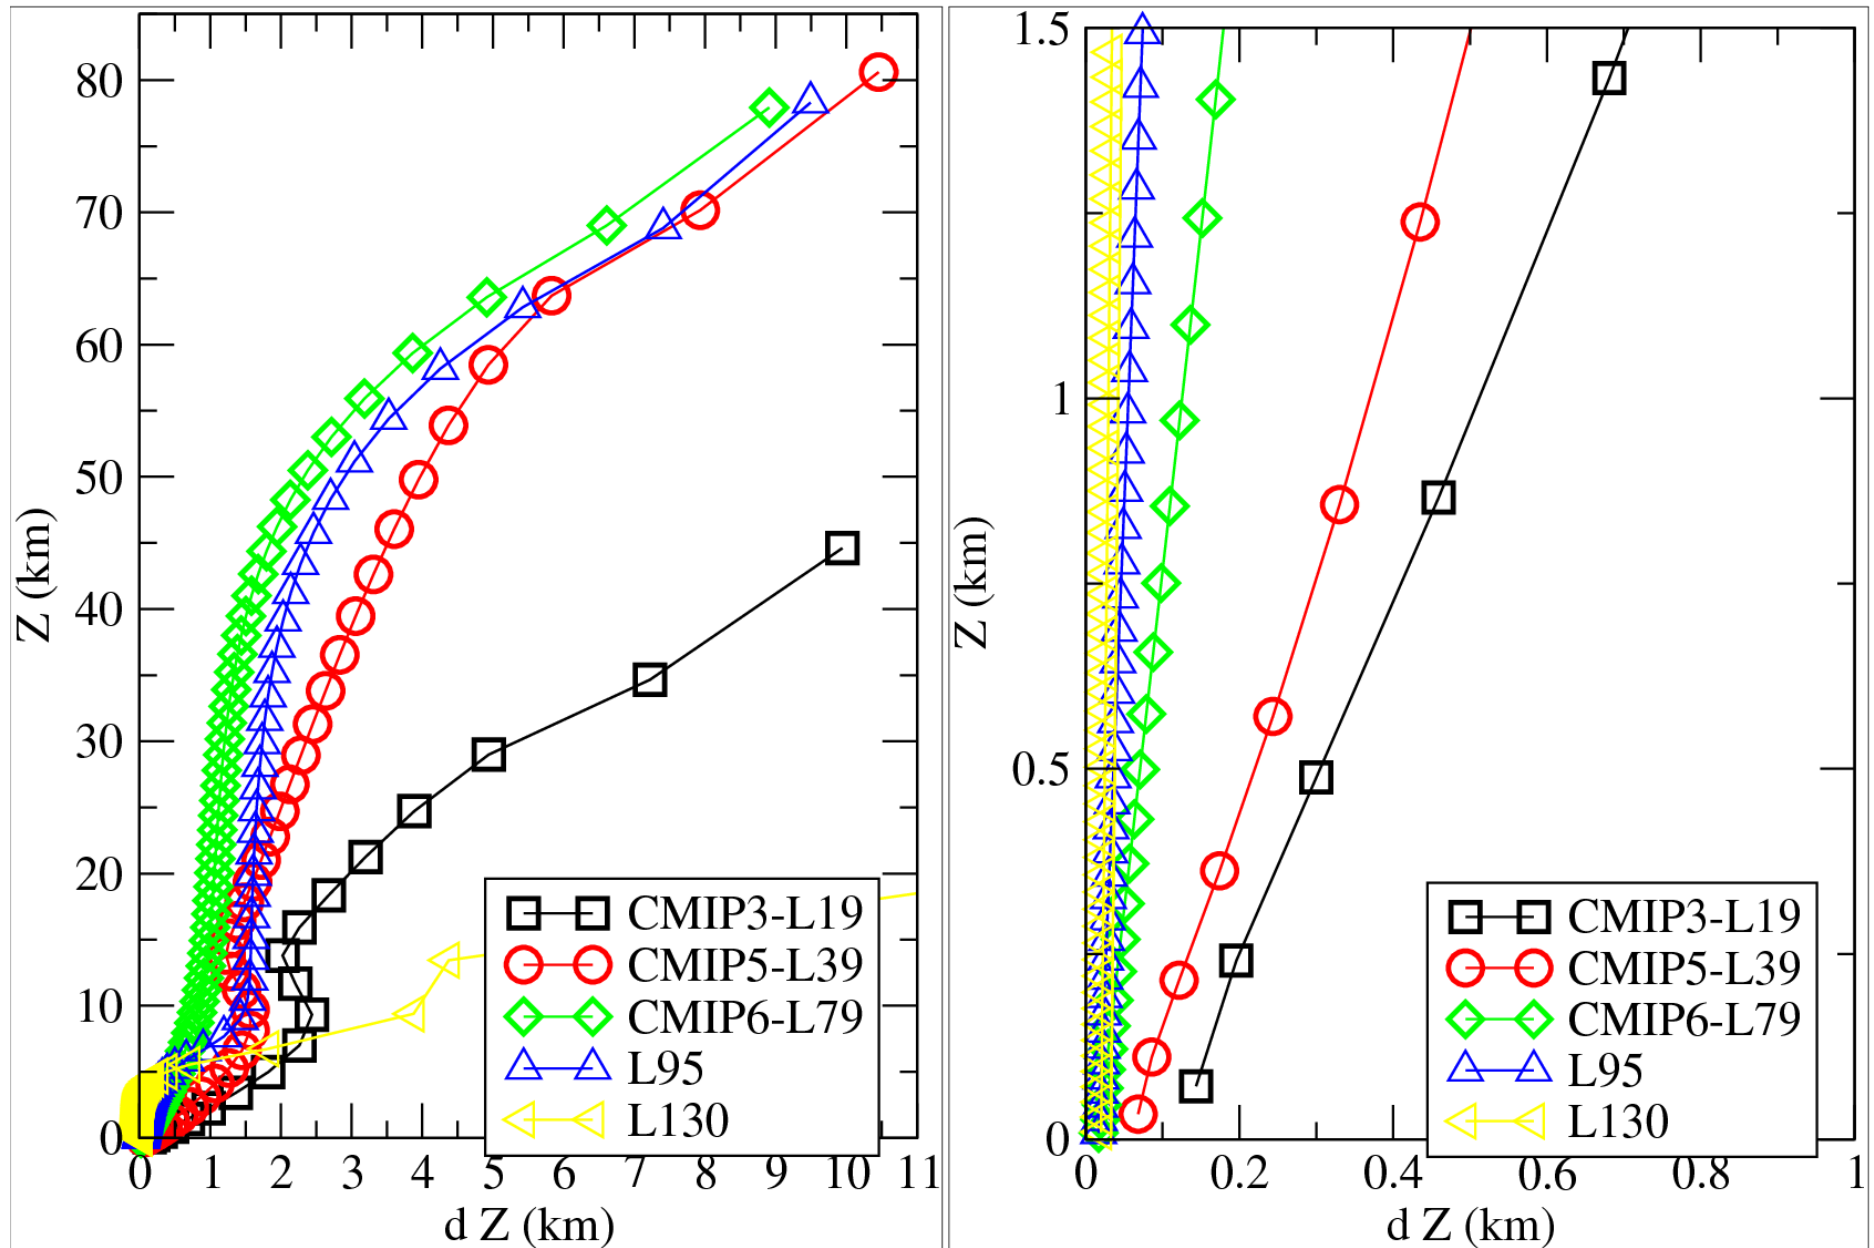

## 2. Reference configurations : b) LMDZ reference configurations

### Summary of reference climate configurations

|       | Horizontal grid                                    | Vertical grid   | Physics content   | Name              |

## 2. Reference versions d) Evolution of climatic biases and sensitivity

**Climate sensitivity highly dependent on model physics.  
IPSLCM among models with high climate sensitivity**

## 2. Reference versions

### Summary

#### Robust improvements

Convective boundary layer : diurnal cycle of clouds and wind

Better cumulus and stratocumulus clouds

Better phasing of the diurnal cycle of deep convection

Intermittency of convection over continents

Better representation of stable boundary layer

QBO representation

#### Biases

Reduced summer continental warm biases in LMDZ6

Better position of the mid-latitude jets

Reduced bias of monsoon rainfall

Reduced warm biases over oceans

Reduced continental surface temperature biases (?)

Enso acceptable but room for improvement

Variability of rainfall too small in LMDZ6 (>LMDZ5A (low) and <B (high))

## **LMDZ : use and configurations**

1. Operating modes of the 3D GCM
  - a) Free climatic mode
  - b) Zooming or/and nudging for climate
  - c) Tracer transport
  
2. Intercomparison exercises and reference versions
  - a) IPSL climate model and CMIP exercises
  - b) LMDZ reference versions
  - c) Robust improvements from version to version
  - d) Evolution of climatic biases and sensitivity
  
- 3. Model development and tuning**
  - a) Choice of a new configuration : content and resolution**
  - b) Importance of tuning**
  - c) Methodology 1D/nudged simulations/tuning**

## 6. Model development and tuning : a) choice of a new configuration

### Definition of model configurations

1. Horizontal resolution and vertical discretization
2. Physical content – Choice of a particular set of parameterizations
3. **Tuning of free parameters !**

Preparation of a configuration is a long process

Sensitivity tests to the grid, physical parameterizations, free parameters  
Compromises. Can depend on team priorities.

For global climate coupled atmosphere/ocean modeling the tuning of the radiative forcing is a key issue. Several months of tuning for one version.

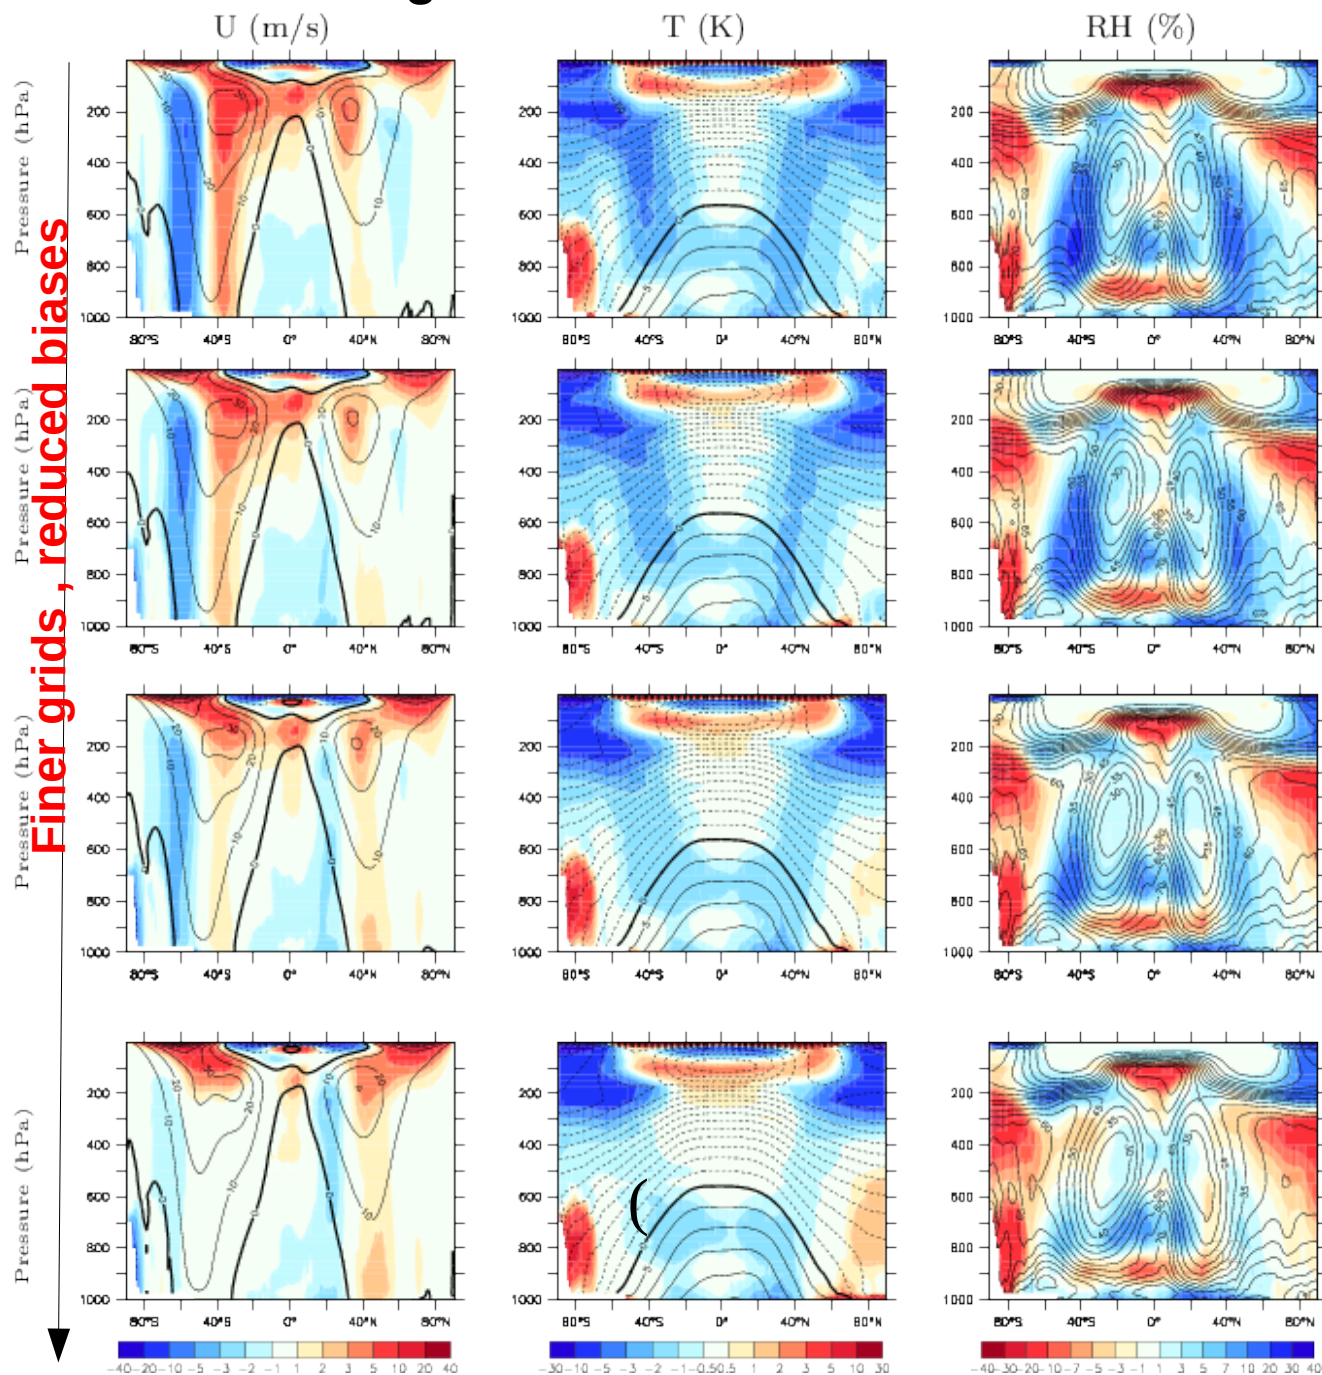

## 6. Model development and tuning : a) choice of a new configuration

### From LMDZ4 to LMDZ5 and LMDZ6 : change of horizontal resolution

Dependance of model biases to the horizontal resolution.

Because of the number of simulations to be performed in CMIP exercises, the reference configurations are a compromise.

The global energy balance is sensitive to the horizontal resolution

## 6. Model development and tuning : a) choice of a new configuration

### Definition of model configurations

1. Horizontal resolution and vertical discretization
2. Physical content – Choice of a particular set of parameterizations
3. Tuning of free parameters !

Preparation of a configuration is a long process

Sensitivity tests to the grid, physical parameterizations, free parameters  
Compromises. Can depend on team priorities.

For global climate coupled atmosphere/ocean modeling the tuning of the radiative forcing is a key issue. Several months of tuning for one version.

## 6. Model development and tuning : b) tuning of free parameters

### Definition of model configurations

1. Horizontal resolution and vertical discretization
2. Physical content – Choice of a particular set of parameterizations
3. **Tuning of free parameters !**

Preparation of a configuration is a long process

Sensitivity tests to the grid, physical parameterizations, free parameters  
Compromises. Can depend on team priorities.

For global climate coupled atmosphere/ocean modeling the tuning of the radiative forcing is a key issue. Several months of tuning for one version.

**1W/m<sup>2</sup> in radiative balance translates into 1K temperature bias in the coupled model**

**Much below uncertainties in modeling and observation of radiative fluxes**

**So the global temperature of climate models is a result of tuning !!!**

## Tuning of free parameter : a fundamental aspect of climate modeling

Feeling that this question was not discussed enough, we organized a one-week workshop on model tuning with Torsten Mauritsen in October 2014 in Garmisch-Partenkirchen.

**The Art and Science of Climate Model Tuning**, Hourdin et al., **BAMS**, march 2017

**One particularly important aspect shared by most groups:  
tuning of cloud parameters to obtain a reasonable representation of radiative forcing**

**Example of tuning of a scale factor on the fall velocity of ice particles shared by several models**

Figure from Mauritsen et al, 2013 (MPI model)

Impact on the global Top-Of-Atmosph. fluxes  
Absorbed SW radiation (ASR)  
Outgoing LW radiation (OLR)

## 6. Model development and tuning : b) tuning of free parameters

### Use of a scaling factor on the fall velocity of cloud ice particles

### Impact on global radiative balance and latitudinal radiative forcing of the circulation

Impact sur les flux globaux au sommet

— Rayonnement SW absorbé

- - - Rayonnement LW sortant

Climate model, parameterizations  
« single-column » mode

# IPSL-CM4 to 6 : (slow) physics improvement + slow resolution increase + tuning free parameters

## Tuning targets:

- Global energy balance
- Decomposition clear sky/CRE
- Latitudinal distribution
- Dyn. regime sorting in tropics
- + « systematic » warm biases
  - Eastern tropical oceans
  - Roaring forties

Accounting for vertical inhomogeneities

Robust improvement Thermal plume model

2012 : CMIP5B « nouvelle physique »  
Thermiques + poches + fermeture

Été 2015, 1eres simulations longues :

- Stabilisation num couche lim.
- Déclench. Stochast. Convect.
- Strato-cus avec thermiques.
- Microphysique glace
- Ondes non orog. → QBO
- L39 → L79

Convection  
- Conditionnée par point de congélation  
- densité de poches diff. O/A  
- réglage w base convection  
- rafales → z0 océaniques

## Concluding remarks / recommendations

### **recommendation when using LMDZ (or analyzing model results)**

LMDZ is a flexible tool (3D, with or without nudging, 1D, coupled or not, aquaplanets, run on HPC computers or laptops, ...)

→ The model setup should depend on the question you want to address.

Try to use referenced configurations when possible

Don't forget that a model is defined by its grid configuration, physical content, tuning parameters, forcing files (aerosols, ozone, ...)

Don't forget the internal variability. Often underestimated.

### **Model evaluation (classical approach) :**

→ Running long simulations or ensembles of them → until you reach robust statistics :

**depends on the variable and question addressed**

→ Compare observations and models in terms of statistics (taking into account that you have only one trajectory among other possible for observations)

### **Alternatives :**

→ Run nudged simulations to get rid of chaos and have the meteorological trajectory in phase with the observed one. Then you can compare model and observation day-by-day. Of course you can not evaluate the large scale circulation itself which is imposed

→ Using 1D simulations for parameterization development and evaluation or studies dedicated to tracer transport and chemistry

## Concluding remarks / recommendations

### Importance of tuning

**A parameterization or a model : Grid configuration + set of equations + tuning**

- Tuning parameters are often uncertain and even not observables
- Tuning is often seen as a dirty part of modeling. It is a misunderstanding !!!!
- Tuning is an intrinsic and very important aspect of climate modeling.
- Especially the tuning of the energetics of atmospheric models
- Tuning should be considered when intercomparing models (if parts of the models use a particular metrics for tuning for instance)

Tuned versions are available for LMDZ : LMDZ5A, 5B, and LMDZ6

Tuning could/should be revisited if the model is significantly modified for an application

### Classical approach for tuning :

- Run a series of sensitivity experiments
- Summarize the skill and deficiencies as a series of metrics or numbers.
- Choose a satisfactory set of parameters values « by hands »
- Limited by the number of parameters that you can explore and by the brain of the scientists who try to make the choice from sensitivity experiments.

### Coming soon :

- Run a series of simulations with a subset of parameter values and use meta-models or emulators to produce the metrics in parameter values which were not explored.
- apply so called objective methods
