Modèle Chimie-transport :LMDz-SACS

- Version 4 (*Houardin et al., 2006*) - Résolution standard : $3,75^\circ \times 2,5^\circ$
- 19 niveaux verticaux - Version off-line - Vents ECMWF

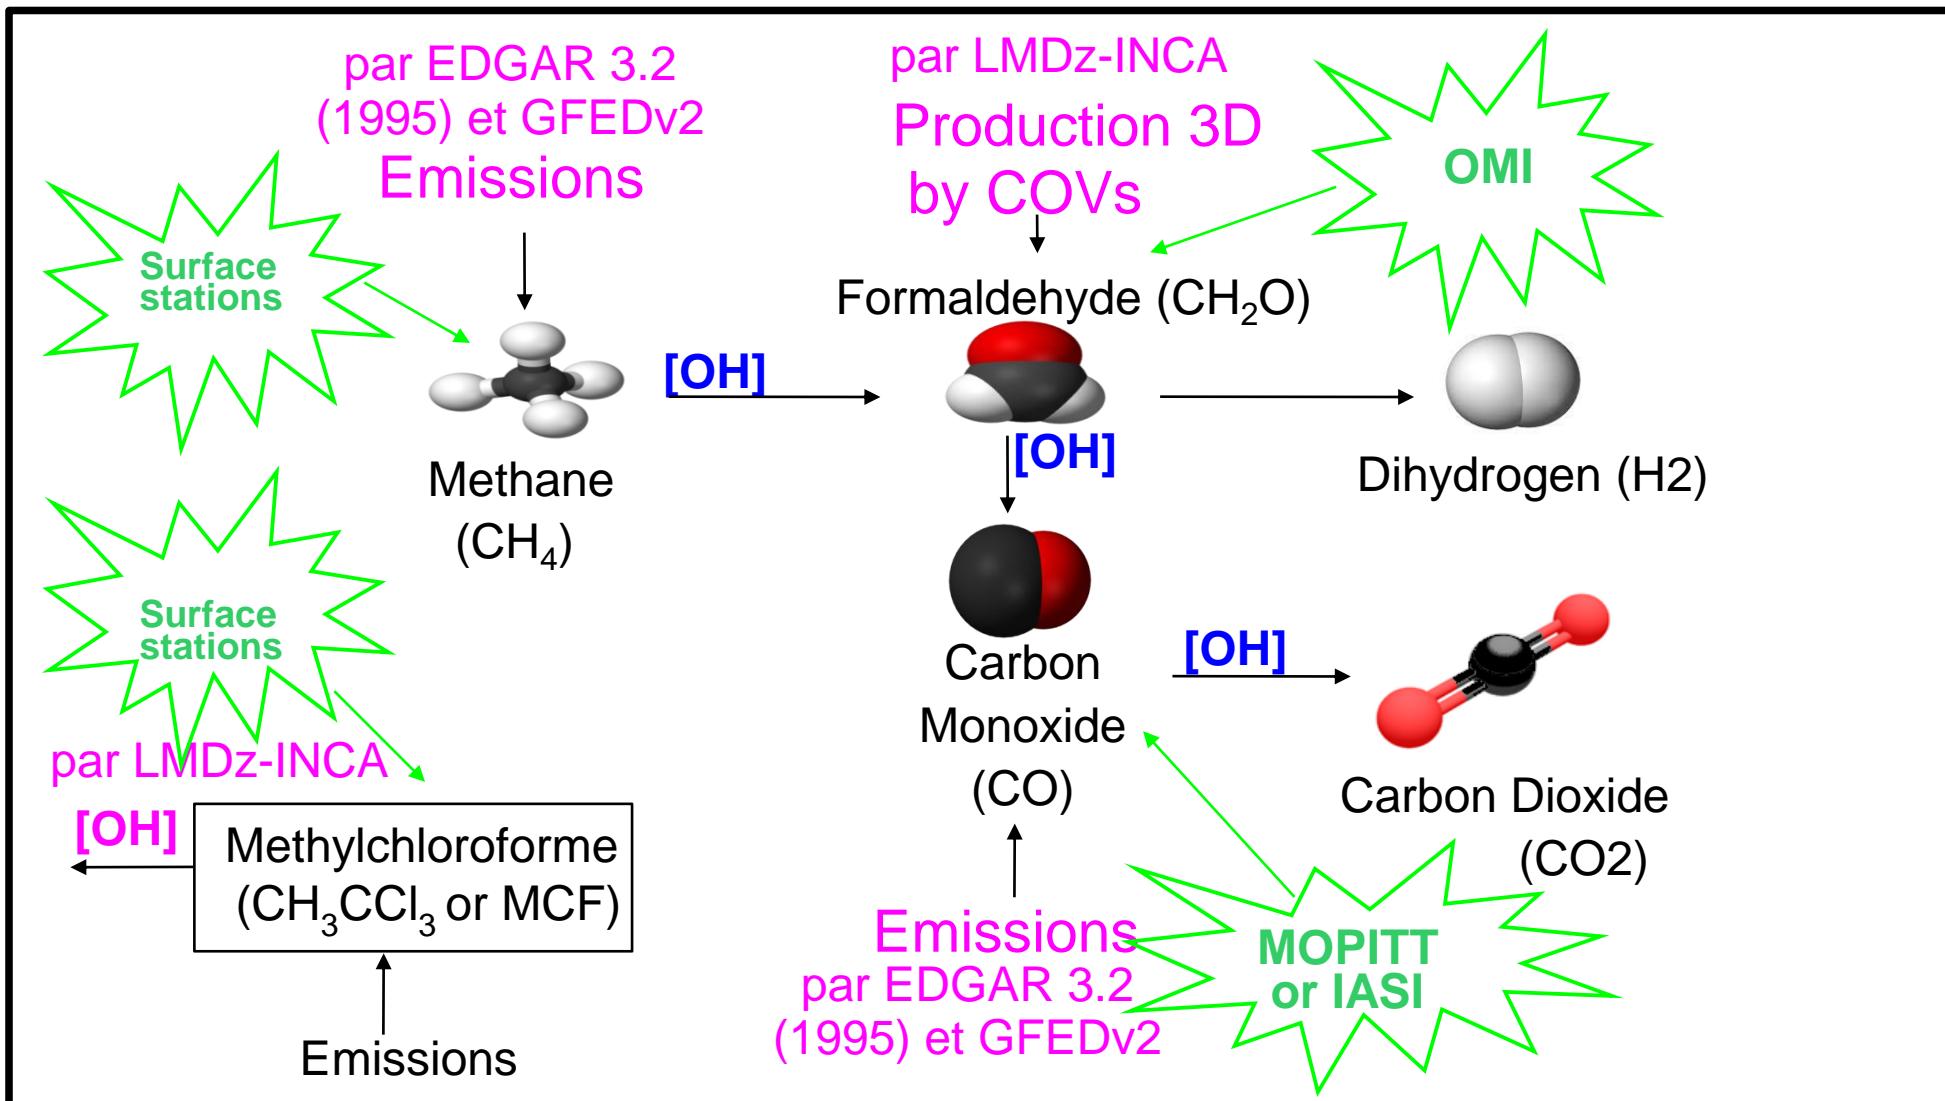

Variables optimisées

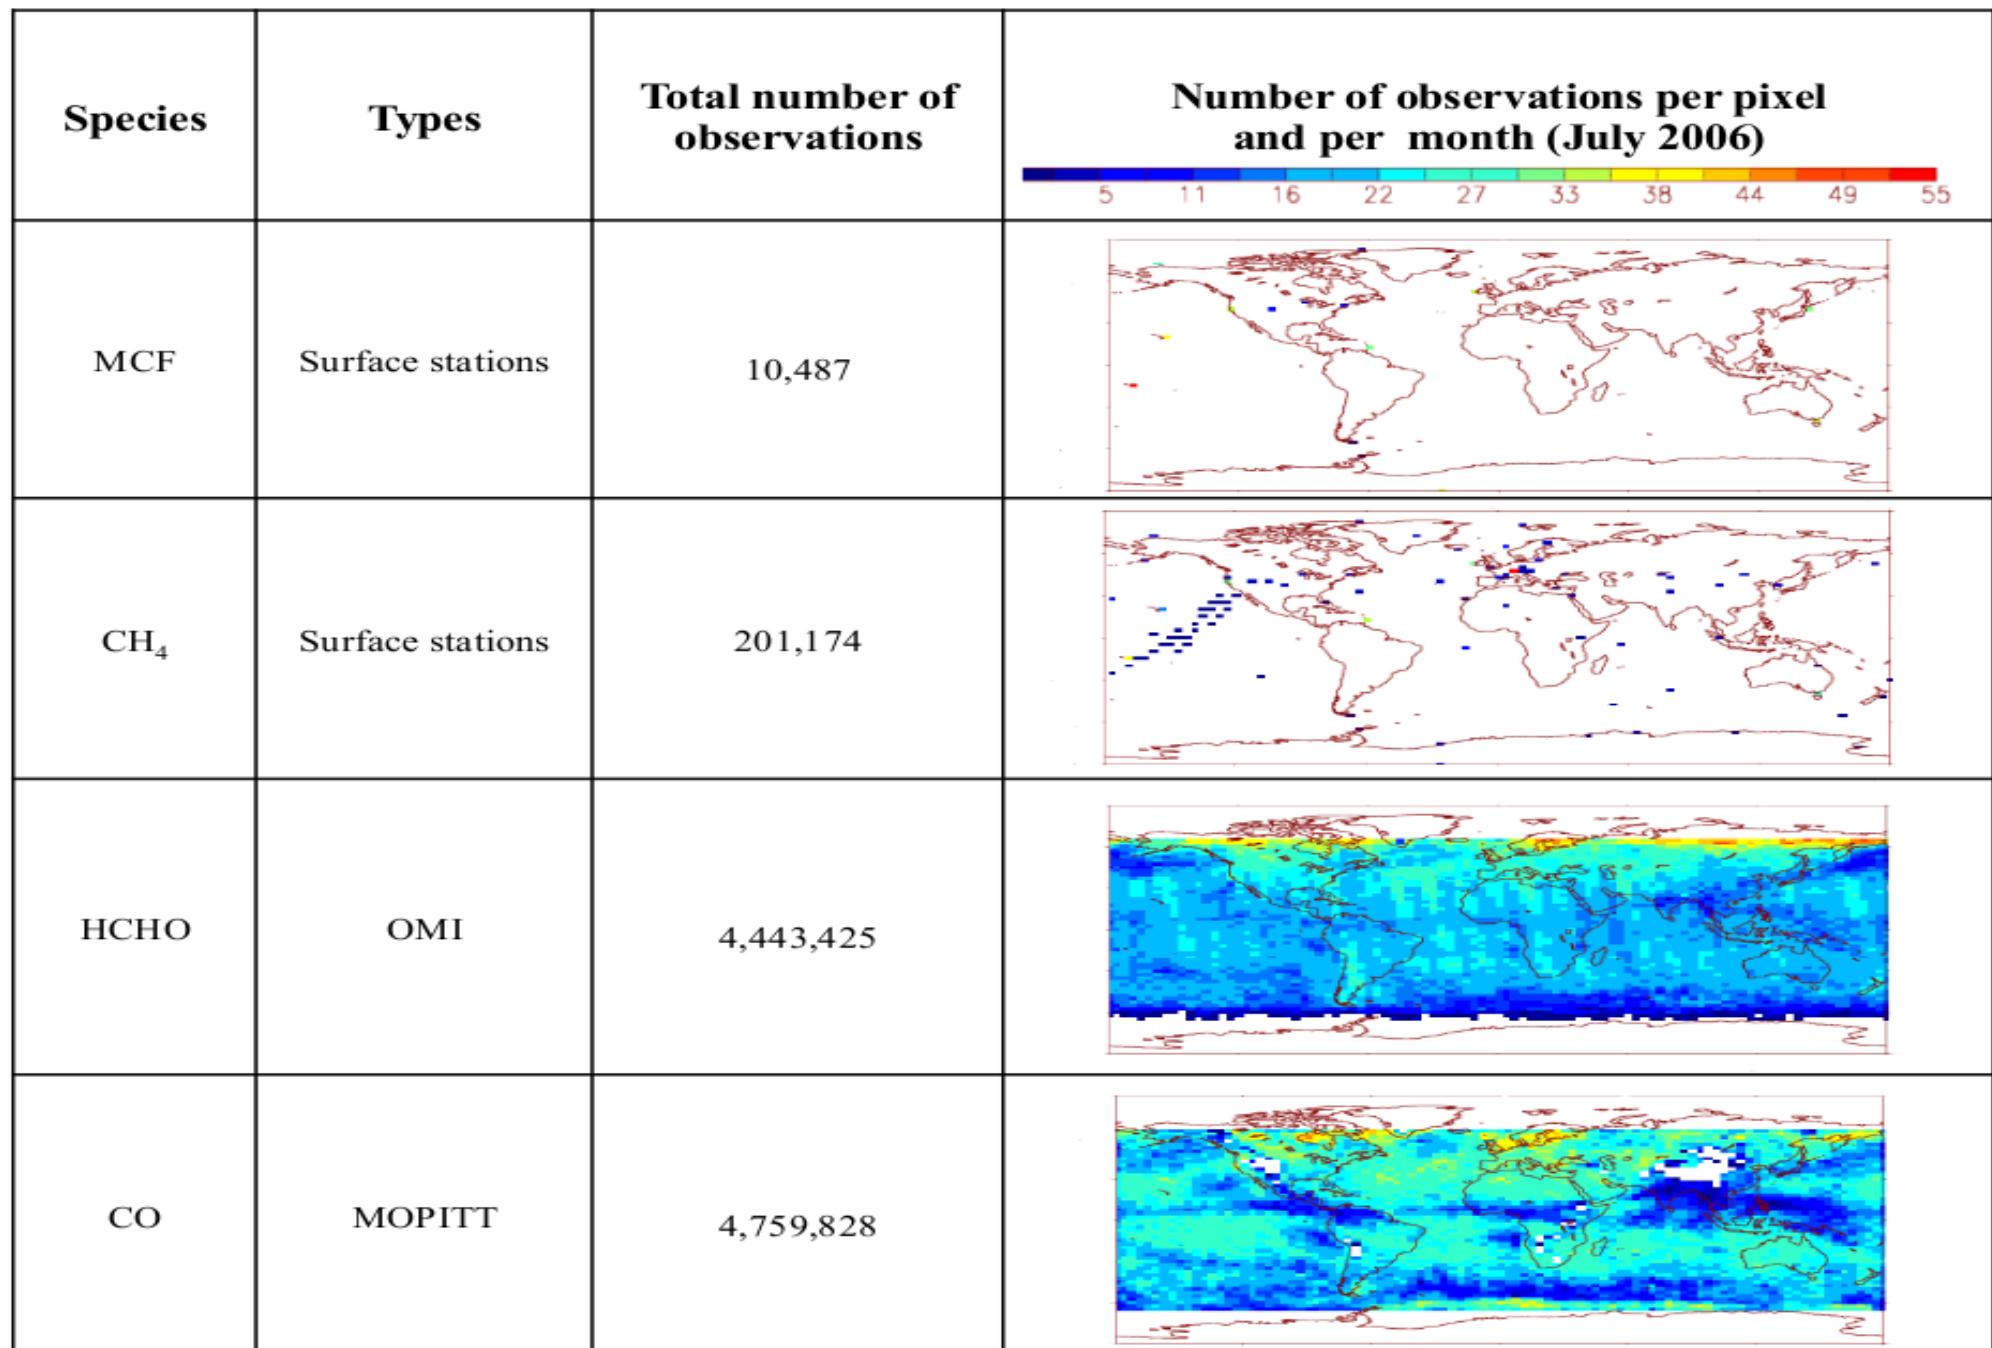

(*Hauglustaine et al., 2004, Folberth et al.; 2006, Pison et al.; 2009*)

Modèle Chimie-transport :LMDz-SACS

Les informations a priori et les observations

(Hauglustaine et al., 2004, Folberth et al.; 2006, Pison et al.; 2009)

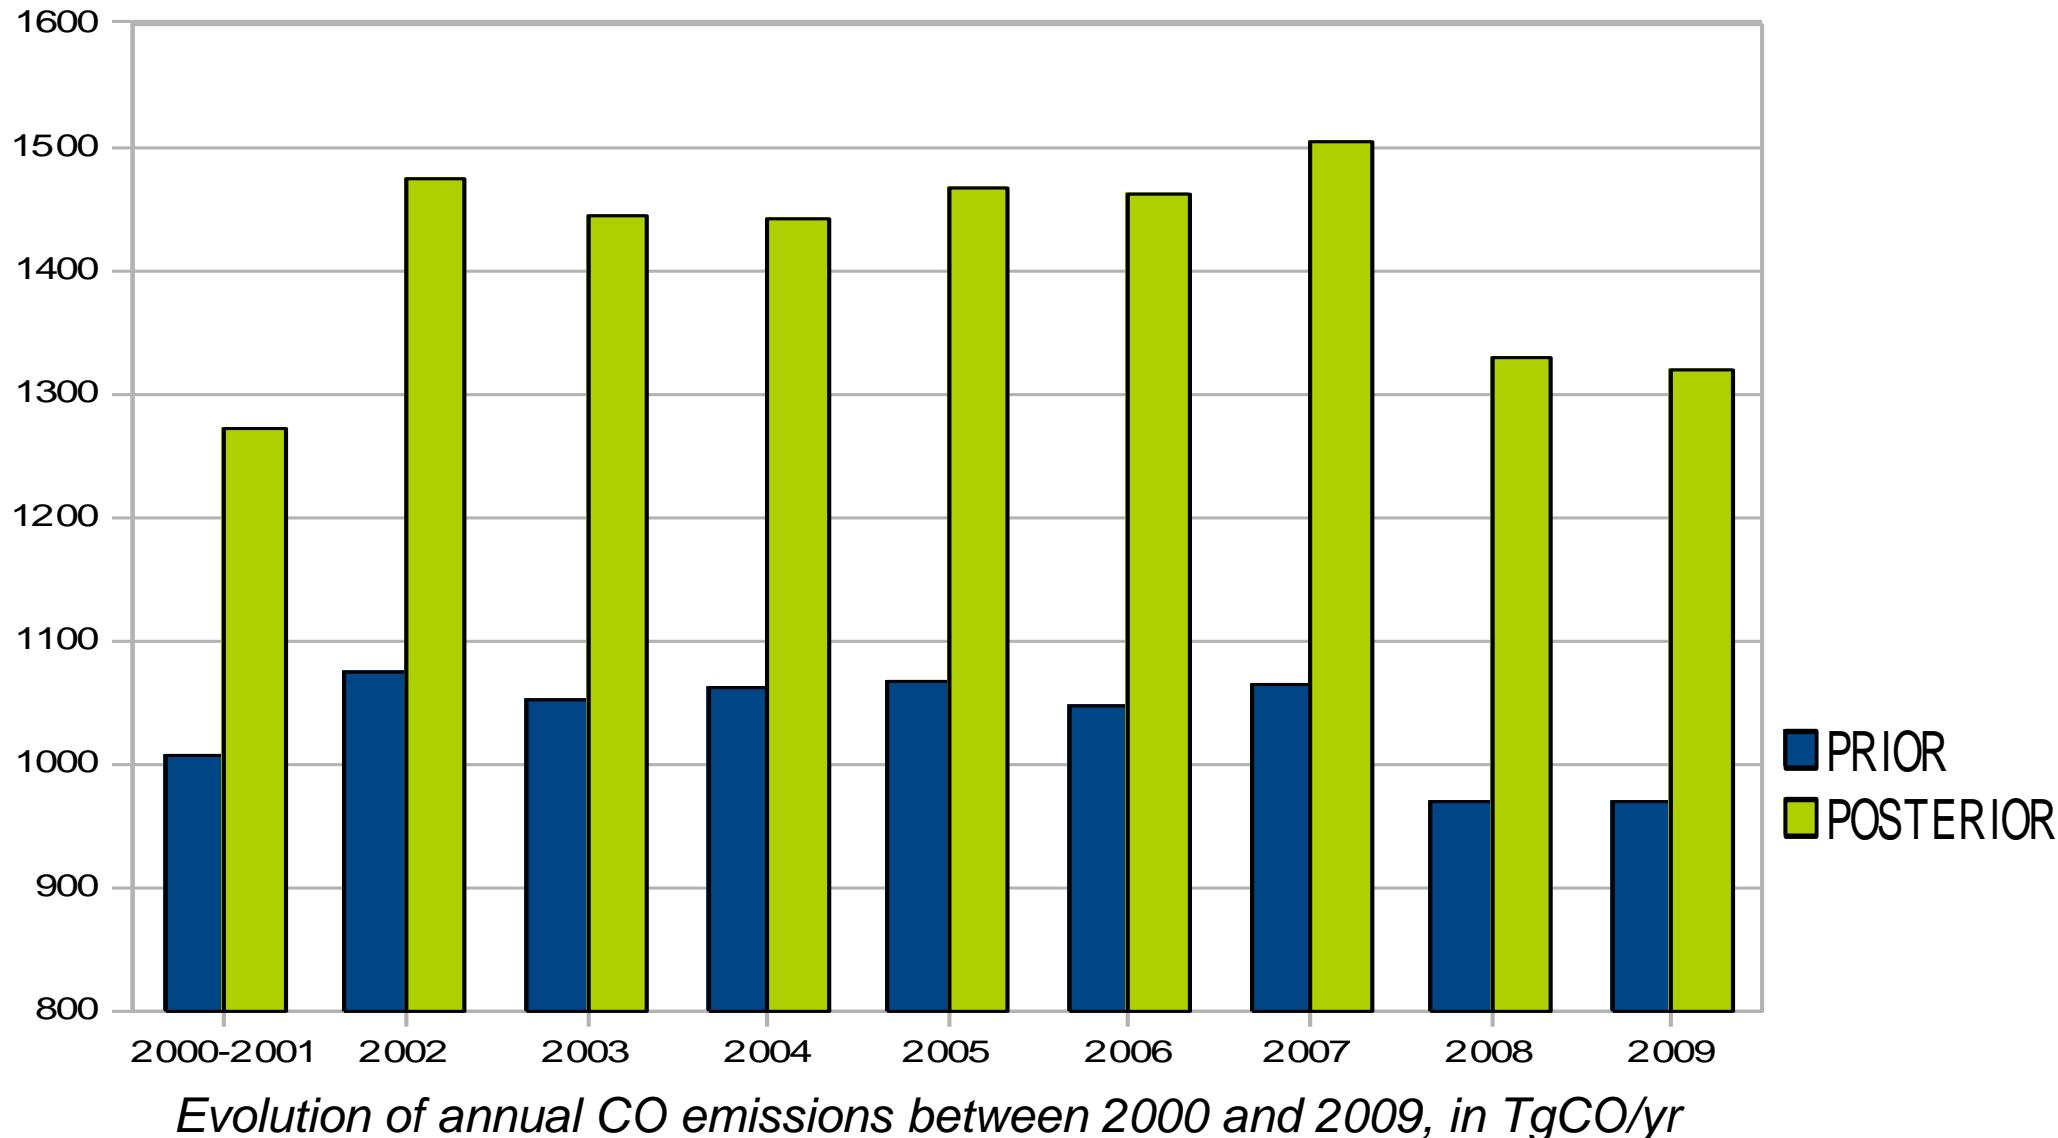

2005-2008 ~ 10 Millions de mesures

Resultats

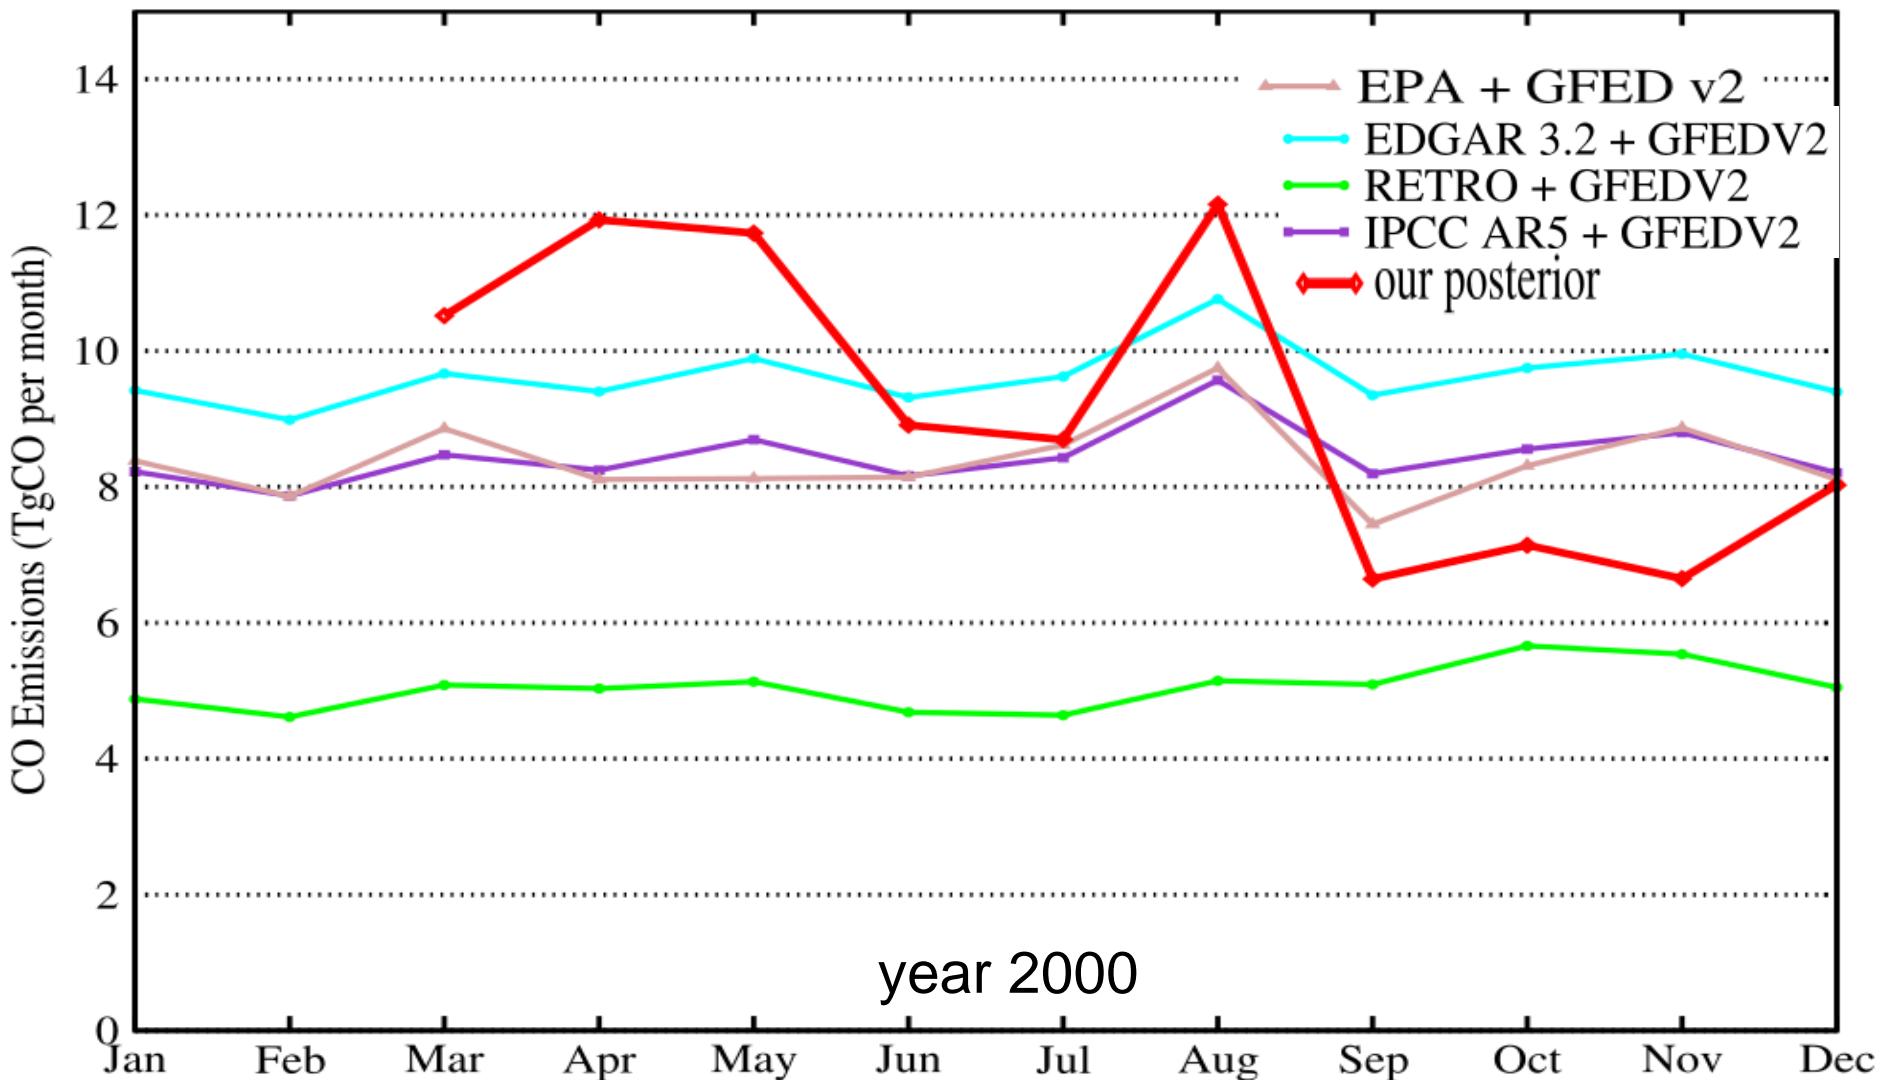

1. Les inventaires a priori sous-estiment les émissions de CO

Emissions a priori mondiales = 1038 Tg/an (moyenne sur les 10ans)

→ Les émissions a posteriori sont 37% supérieures aux émissions a priori (~1430 TgCO/an)

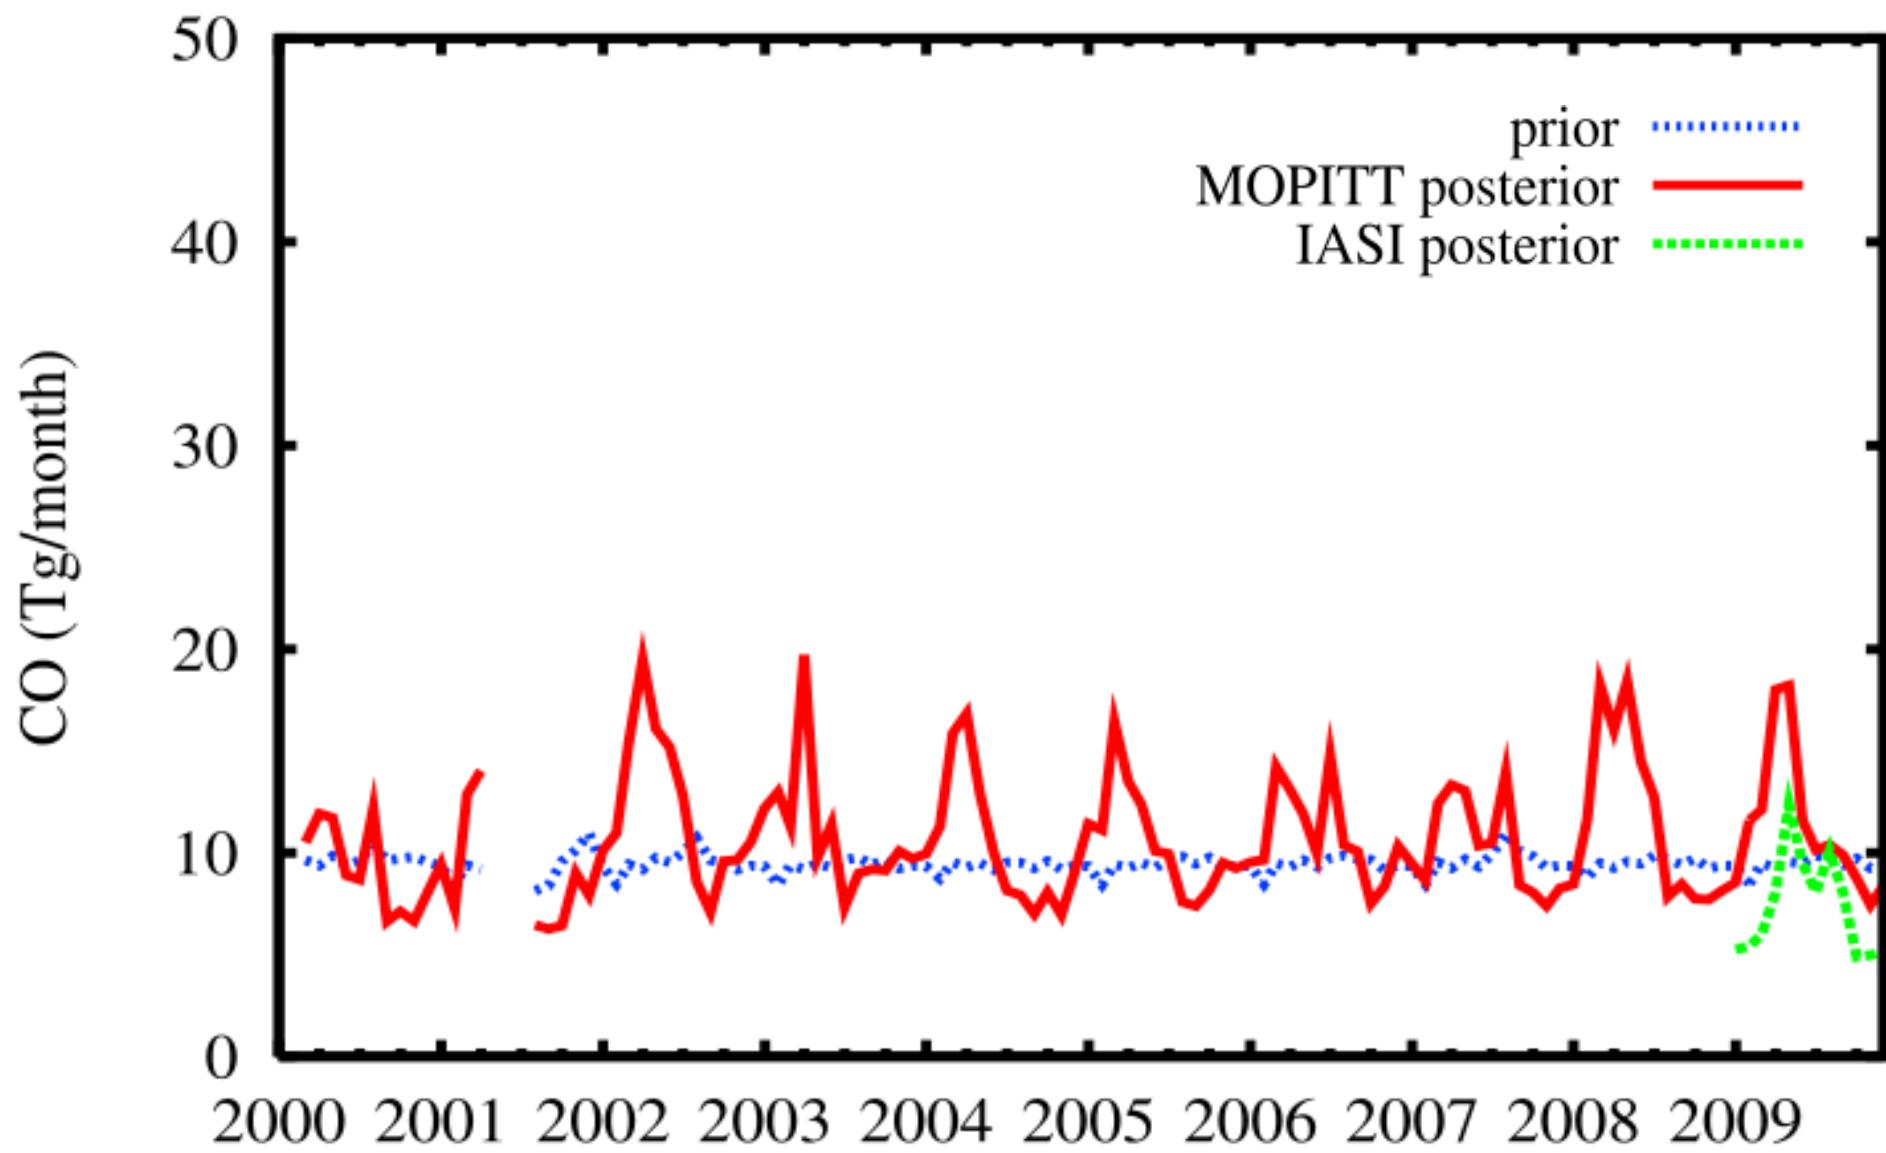

2. Variations saisonnières dans l'hémisphère Nord (aussi montré par Kopacz et al., 2010)

USA

USA

3. Émissions régionales de CO en TgCO/yr: synthèse pour 2005

	USA	China	Canada	Western Europe	Global
EDGAR3.2+ GFED2 (our prior)	105	108	8	44	1066
Posterior MOPITT+mcf	112	213	49	52	1467
Posterior MOPITT+OMI +mcf +ch4	132	151	54	58	1401
EDGAR 4.2+GFED3	60	96	12	22	1284

TransCom model simulations of CH₄ and related species: linking transport, surface flux and chemical loss with CH₄ variability in the troposphere and lower stratosphere

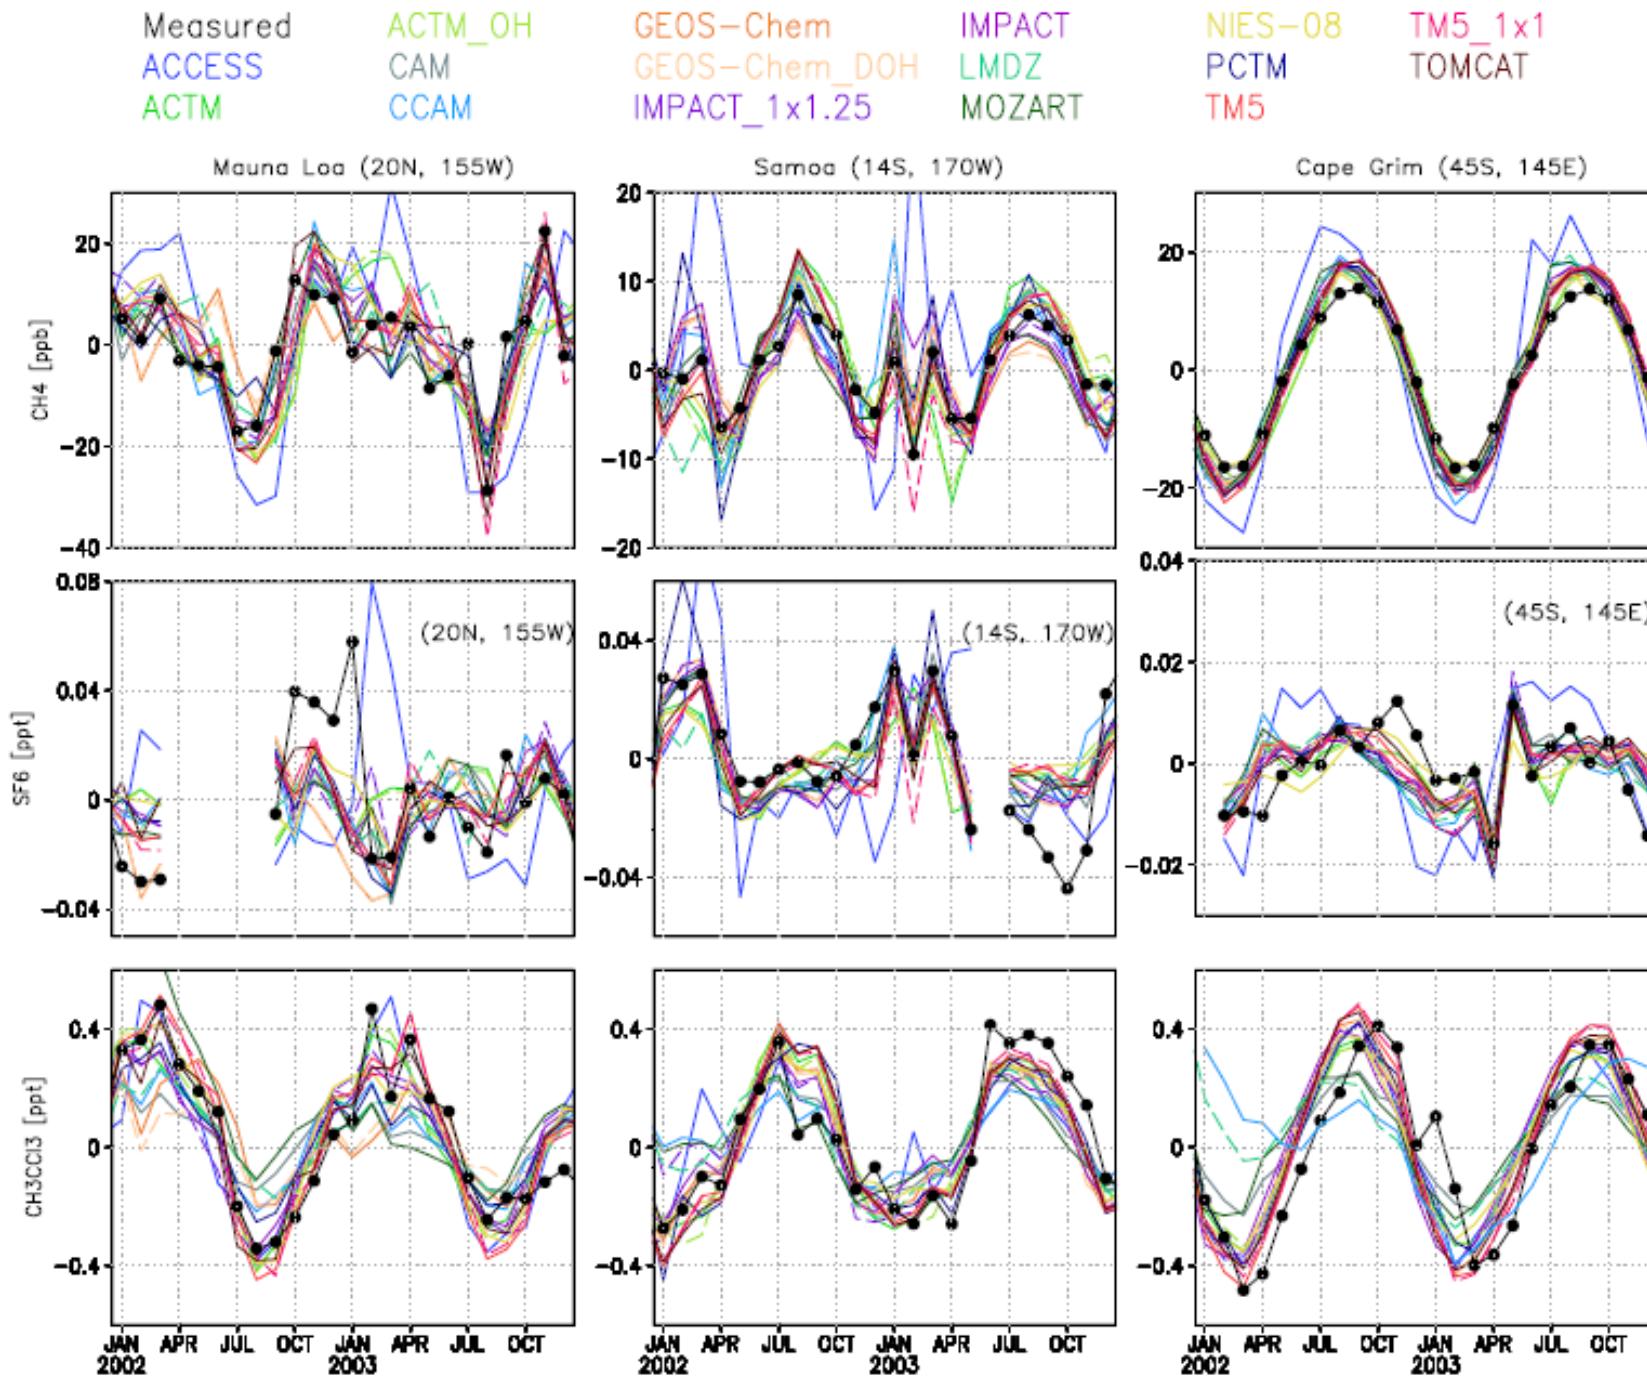

P. K. Patra, S. Houweling, M. Krol, P. Bousquet, D. Belikov, D. Bergmann, H. Bian, P. Cameron-Smith, M. P. Chipperfield, K. Corbin, A. Fortems-Cheiney, A. Fraser, E. Gloor, P. Hess, A. Ito, S. R. Kawa, R. M. Law, Z. Loh, S. Maksyutov, L. Meng, P. I. Palmer, R. G. Prinn, M. Rigby, R. Saito, and C. Wilson

Comparaison de 12 modèles pour des simulations directes de CH₄, SF₆ et MCF

Sl. No.	Model name ^a	Institution ^b	Resolution		Meteorology ^e	Avg. lifetime (1992–07) ^f	
			Horizontal ^c	Vertical ^d		CH ₄ -CTL	CH ₃ CCl ₃
